ABSTRACT:

Digital transformation has profoundly changed the Indian banking sector, which has made digital banking services an important part of everyday financial activities (Harahap et al., 2024; Bhatnagar et al., 2024). Public sector banks, particularly the State Bank of India (SBI), have aggressively promoted digital platforms such as SBI YONO, mobile banking, internet banking, and UPI to enhance service accessibility and operational efficiency. Although the growing dependence on online banking has additionally resulted in digital banking errors, including UPI transaction failure, amount debited but not credited, delayed refund, login or app crash issues, server or technical issues, authentication issues, and security-related issues (Choudhuri et al., 2024; Yacoubian, 2025). These errors have the potential to negatively affect customer trust, which is a fundamental element of the bank–customer relationship (Haider et al., 2024).

This study inspects customer trust in the circumstances of digital banking errors among SBI Bank users in Ranchi. The researcher looks for to understand the nature and frequency of digital banking errors, their impact on customer trust, and customer perceptions regarding SBI's grievance redressal mechanisms. The study employs a descriptive research design. Primary data has been collected by a structured questionnaire managed by SBI digital banking users in Ranchi, although secondary information has been gathered from academic journals, reports, and official publications.

The study aims to generate practical insight that can help banks in improving digital services quality, building up or strengthening the grievance redressal systems, and enhancing customer trust. The findings are expected to enhance digital banking services and offer insightful advice to the public sector banks in creating reliable, customer-centric digital banking platforms.

INTRODUCTION

The banking sector in India is rapidly adopting digital banking services and transforming due to technological advancements **(Harahap et al., 2024; Basingi, 2025)**. Traditional banking methods, which heavily depend on bank branches and manual processes, are gradually being replaced by digital modes of service delivery. Digital banking allows customers to access financial services anytime and anywhere, thereby improving convenience, speed, and accessibility **(Yadava et al., 2025)**. Government initiatives such as Digital India, financial inclusion programs, and the promotion of cashless transactions have further accelerated this transformation **(Poojari & Sanoj Kumar, 2025)**. The growth of affordable smartphones, digital literacy, and internet connectivity has moreover enhanced this transformation. Thus, digital banking is turning into a necessary part of everyday life, empowering customers to perform financial transactions at any time in any location.

The State Bank of India, the largest public sector bank in India, has played a significant role in promoting digital banking services. Platforms such as SBI YONO, mobile banking, internet banking, and UPI have become widely used for daily transactions, including fund transfers, bill payments, and account management **(Sharma, 2025; Sundaralakshmi & Rajamannar, 2025)**. In a city like Ranchi, where technical awareness and digital infrastructure are continuously improving, people steadily depend on digital platforms for daily banking activities.

Ranchi is emerging as a developing digital ecosystem where both technologically advanced users and first-time digital banking users coexist. This diversity creates variations in perceptions, experiences, and levels of confidence in online banking systems **(Harahap et al., 2024)**. Customers in Ranchi involve digitally advanced users as well as first-generation digital banking users. Whereas younger users may adapt easily to digital platforms, long-standing clients and less digitally educated users may experience a higher level of concern and uncertainty when facing digital banking errors.

But the growing dependence on online banking systems has introduced several challenges. Customers often face issues such as transaction failures, delayed refunds, server errors, authentication failures, and security concerns **(Choudhuri et al., 2024; Yacoubian, 2025)**. These mistakes could occur because of technical limitations, network failure, system overload, or operational inefficiencies. Even though many of these issues are temporary, their impact on customers is significant.

Digital banking errors create financial inconvenience and lead to psychological stress, dissatisfaction, and anxiety among users **(Basingi, 2025)**. Customers may be scared of financial loss, misuse of data, or system unreliability, which directly affect their trust in online banking systems. When such errors happen repeatedly or continuously remain unresolved for a long time, they can seriously erode the customer's trust in the bank.

Customer trust is a fundamental component of banking relationships and plays a vital part in the uptake of digital financial services **(Haider et al., 2024; Choudhuri et al., 2024)**. In digital banking, trust becomes even more important because transactions happen without any direct physical contact between the customer and the bank staff. Consumers are more likely to notice mistakes, delays, and service failures when they don't receive face-to-face reassurance. Customer trust refers to the belief that a bank will handle money, data, and services in a safe, reliable, and responsible way. In the digital banking environment, this trust depends on how smoothly systems work, how well personal information is protected, how clearly the bank communicates with customers, and how quickly problems are solved.

When customers experience repeated failures, their trust declines, which could lessen their readiness to continue using digital services **(Yacoubian, 2025)**. Therefore, maintaining trust is essential for long-term customer retention and satisfaction **(Harahap et al., 2024)**. Over time, this loss of trust can reduce their willingness to depend on digital banking and may push them back toward traditional banking methods.

Understanding customer trust in the context of digital banking errors is important for banks seeking to improve service quality and customer satisfaction. Trust decides whether customers will continue digital platforms, move to alternative service providers, or return to traditional banking systems or methods. In the competitive digital financial ecosystem, customer trust has become a calculated strong point for banks.

This study focuses on examining customer trust in the wake of digital banking errors among SBI Bank users in Ranchi. By scanning customer experiences, perceptions, behavioral responses, and trust dynamics, the study aims to develop profound insight into how digital service failures impact customer trust and confidence in banking institutions. The research goes beyond identifying technical errors and inspecting the psychological, emotional, and behavioral outcomes of such failures on customers. It points to generating meaningful perceptions that can support banks in designing more authentic digital systems, building up wrong redressal mechanisms, and developing customer-centric digital services that prioritize dependability, transparency, and responsiveness.

The study additionally emphasizes the function of institutional responsibility and service recovery in reconstructing customer trust after digital service failures. Trust in digital banking is not formed only by technological performance but also by how effectively banks answer customer problems, communicate during the service disruptions, and solve the complaints. By analyzing customer feedback and trust perceptions, the study focuses on the importance of empathetic service delivery, clear and transparent communication, and efficient problem resolution in encouraging long-term customer relationships in digital banking environments.

In addition to its applications, this research helps academic research by providing a city-specific observational comprehension of the connection between digital banking errors and customer trust in a public sector in a banking context. It enhances the literature by combining technological, behavioral, and institutional elements or dimensions of trust within a localized urban area. The findings are expected to add value to our research on digital banking, customer trust, and service quality while offering a conceptual model that can be used for studies in similar socio-economic and banking environments.

LITERATURE REVIEW

- ➢ Amit Yadava et al. (2025) expressed that online banking systems have improved customer relationships by making banking services faster, easier, and more usable. According to their research, digital tools help increase consumer satisfaction and trust through better service experiences. Nonetheless, the research did not focus on digital banking errors or their effect on customer trust, which the present study aims to address.
- ➢ Haider et al. (2024) studied the role of digital banking services in building customer trust and promoting the use of e-payment or digital payment systems. Their findings indicated that trust is pivotal in the acceptability of digital banking; nevertheless, the analysis did not concentrate on digital banking errors or their impact on customers' trust, which this study seeks to examine.
- ➢ Sharma and Gupta (2025) examined the influence of digitalization and fintech on client happiness and loyalty within the banking sector, concluding the digital banking services provide secure, seamless, and superior experiences that foster enduring customer loyalty. But their research did not specifically address the role of digital banking errors (such as transaction failures, technical glitches, and delayed refunds) or how such failures affect customer trust, which the present study seeks to investigate.
- ➢ Lavanya and Rajkumar (2024) explained that digital banking services improved access and convenience for customers during the COVID-19 period. But their research did not examine digital banking errors or their impact on customer trust, which the current study aims to address.
- ➢ Poojari and Kumar (2025) studied the effects of online banking services on customer satisfaction in India and found that factors such as ease of use, security, accessibility, and transaction speed play a

major role in shaping customer experiences. Their study indicated that digital banking has a positive effect on customer satisfaction and loyalty. However, the research did not focus on digital banking errors or their impact on customer trust, which the present study aims to address.

- Basingi (2025) showed that digital banking makes services faster and more convenient for customers, improving their overall experience. However, the study did not explore how digital banking errors affect customer trust, which the present research aims to examine.
- Choudhuri et al. (2024) showed that trust in digital banking grows when systems feel safe and reliable, but their study did not explore how digital banking errors affect customer trust, which the present research aims to address.
- Kumar et al. (2024) showed that digital banking improves service quality and customer experience, but their study did not examine how digital banking errors affect customer trust, which the present research aims to address.
- Sharma et al. (2024) discovered that digital banking services enhance client satisfaction by making banking easier, faster, and more convenient. However, the study did not examine how digital banking errors affect customer trust, which the present research seeks to investigate.
- Michael (2024) showed that strong cybersecurity builds trust in digital banking, but the study did not examine how daily digital banking errors affect customer trust, which this research aims to address.

OBJECTIVES AND GOALS

This research uses a descriptive approach design to examine customer trust in digital banking errors. Descriptive research is appropriate for analyzing existing conditions and customer perceptions **(Bhatnagar et al., 2024)**. The study focuses on analyzing how digital banking errors such as transaction failures, technical glitches, delayed refunds, login or app crash issues, server or technical issues, authentication issues, and security issues affect customers' confidence, satisfaction, and trust in SBI digital banking services. This study also focuses on understanding the characteristics of grievance redressal mechanisms in maintaining and refreshing customer trust in digital banking platforms.

Goal: The primary purpose of this research is to analyze how the effects of faults in digital banking upon consumers' trust among the users of the State Bank of India (SBI) in Ranchi are for academic and research purposes.

Specific Objectives

- To identify the common types of digital banking errors faced by SBI bank users in Ranchi, such as UPI transaction failure, amount debited but not credited, delayed refund, login or app crash issue, and server or technical issue.
- To examine the effect of digital banking errors upon customers' trust.
- To scan the customer perceptions regarding SBI's response to digital banking errors.
- To examine the customer satisfaction with grievance redressal mechanisms related to digital banking services.
- To suggest measures for enhancing customer trust in digital banking.

RESEARCH METHODOLOGY

The research methodology offers a structured framework for comprehending the study's design, data collection, and subsequent analysis of findings. It ensures validity, transparency, and reliability in examining customer trust in the context of digital banking errors among users of the State Bank of India in Ranchi. This methodological structure supports the credibility of the study and enables meaningful interpretation of customer perceptions, experience, and behavioral responses to digital service failures.

RESEARCH DESIGN

This study uses a descriptive research design to examine customer trust within the framework of digital banking errors. The design is particularly acceptable because the research focuses on understanding existing conditions rather than manipulating variables. Descriptive research allows for a detailed representation of customer experiences, attitudes, perceptions, and behavioral reactions related to digital banking services.

Through this approach the study looks for systematically documented types of digital banking errors experienced by customers, such as UPI transaction failure, amount debited but not credited, delayed refund, login or app crash issue, and server or technical issue. It also inspects how these experiences influence customer trust, confidence, satisfaction levels, and continued usage of digital platforms. By observing customer behavior in context, the descriptive design ensures that the findings reflect authentic user perceptions rather than artificial experimental conditions.

This design further supports the study's objective of generating practical insights that can guide policy formulation, service improvement, and standard customer relationship management techniques in the banking industry. By highlighting the realities of digital banking, this descriptive approach provides insights that are immediately applicable to both academic research and institutional strategy.

AREA OF STUDY

Ranchi is emerging as a growing digital and financial ecosystem with increasing acceptance of online banking services **(Poojari & Sanoj Kumar, 2025)**. Rising smartphone usage, improved internet access, and widespread adoption of digital payment platforms make the city an appropriate framework for studying electronic financial behavior.

Ranchi has a socially and economically diverse population, including students, professionals, business owners, government employees, and informal sector workers. This diversity allows the study to capture different or mixed customer experiences, digital literacy levels, and service expectations. Everyday life in the city involves frequent use of digital banking services such as mobile banking apps, internet banking platforms, and UPI transactions, making digital finance a routine part of people's daily activities.

By focusing on Ranchi, the study captures a city-specific and real-life understanding of how customers experience and perceive digital banking services, offering practical insights that can help public sector banks improve service quality and strengthen customer trust.

Sample Size and Sampling Technique

The sample includes customers of the State Bank of India (SBI) who regularly use digital banking services such as mobile banking, internet banking, and UPI for their daily financial transactions. A convenience sampling technique has been used, where respondents were selected based on their easy availability, accessibility, and willingness to participate in the study. This method made it easier to reach the genuine or those who actively engage with digital banking in their daily lives and who have real experience with online transactions.

The final sample size depends on the number of valid and complete questionnaires received during the data collection process. Only properly filled and usable responses were included in the study to ensure the reliability and accuracy of the data. This approach helps in capturing or taking the real customer experiences and perceptions in a practical and realistic way.

DATA COLLECTION METHOD

The study uses both the primary and the secondary data to gain a clear and complete understanding of the research problem.

Primary Data Collection

Primary data was collected through a structured questionnaire specially prepared for the study. The questionnaire contains simple and clear questions so that respondents can easily understand the questions and answer them. It was designed to collect information on:

- Basic details of the respondents
- How often and in what ways they use digital banking services
- Types and frequency of digital banking errors they face
- How safe and reliable they feel digital services are
- Their level of trust in digital banking platforms
- Their satisfaction with complaint handling and grievance redressal systems
- Their reactions and behavior after facing digital banking problems

Using a structured questionnaire helped maintain uniformity in data collection and made it easier to compare responses. It also allowed the study to measure the trust, satisfaction, and perceptions in a clear and organized way. The questions were kept simple so that the people from different educational and social backgrounds could understand and respond comfortably.

Secondary Data Collection

Secondary data was collected from academic journals, reports, and official sources to support the theoretical framework and contextual understanding of digital banking and customer trust **(Haider et al., 2024; Yacoubian, 2025)**.

E-ISSN: 3139-0668
Volume: I, Issue: II

- Research journals and academic articles
- Books and scholarly publications
- Banking and financial sector reports
- Government and regulatory documents
- Official websites of banks
- Reports and documents related to digital banking policies

This secondary information helped in building the theoretical base of the study and understanding the broader context of digital banking and customer trust. It also supported the analysis by linking the primary findings with existing research and established concepts in the banking and financial services field.

Tools for Data Analysis

The information gathered will be analyzed using simple and easy-to-understand methods so that the results are clear, accurate, and meaningful.

The main tools used in the study include:

- Percentage analysis, to understand how responses are distributed across different questions
- Tables, to arrange the data in an organized and clear format
- Graphs, such as bar charts and pie charts, to show patterns and trends in a visual and easy way

These methods help in identifying common problems faced by customers, levels of trust, frequency of digital banking errors, and satisfaction with grievance redressal systems. Visual tools make the information easier to understand and help readers quickly see important patterns in the data.

Using simple analysis techniques keeps the study transparent and easy to follow. It avoids unnecessary technical complexity and helps focus on understanding customer experiences and perceptions in a practical and meaningful way. This makes the findings useful not only for academic purposes but also for real-world decision-making in banking services.

SWOT ANALYSIS

Dimension	**Analytical Description**

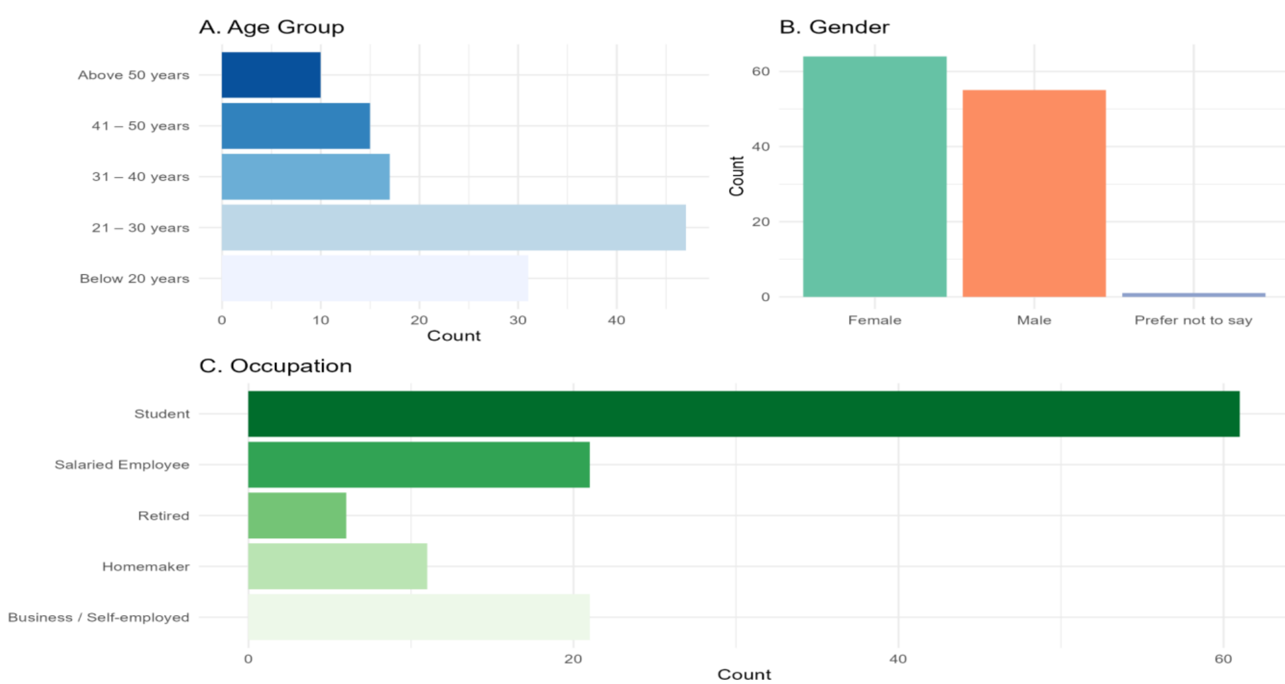
Strengths	People trust the bank because of its long history and reliability, which helps them feel calm and confident even when digital problems happen. Many customers believe the issues will be fixed, so they stay patient and continue using the services instead of losing trust quickly or easily. The bank's digital services make banking easy to access for people through mobile apps, online platforms, and UPI, so customers can manage their money anytime without depending on branch visits. It also provides clear and simple ways for customers to register complaints and get help, which helps rebuild trust after problems, while the variety of customers across different ages, incomes, and digital skill levels allows the study to understand experiences and trust patterns from many real-life perspectives.
Weakness	When customers face repeated problems like failed payments, money not coming back on time, login difficulties, or app breakdowns, they start losing confidence in how reliable the digital services are. Poor communication during these problems makes people feel confused, worried, and stressed, especially when they do not know what is happening. Many users who are not comfortable with technology become dependent on others for help and develop fear of using digital platforms, while slow coordination between different departments delays problem-solving and further reduces customer confidence.
Opportunities	As more people start using digital banking, there is a strong chance to improve services and make platforms simpler and more user-friendly. Clear and real-time updates about transactions and problems can help customers feel more relaxed and trusting when something goes wrong. Training programs and awareness activities can help people become more confident in using digital services, and research based on local experiences can guide better policies and improvements in public banking systems.

Threat	Online fraud, scams, and fake messages make people afraid of using digital banking, and many users lose trust even when the bank is not directly at fault. When systems fail, a large number of customers simultaneously experience the effects of heavy dependence on technology. At the same time, fast and smooth services offered by private banks and fintech platforms raise people's expectations, making them more critical of traditional systems, while changing rules and regulations force banks to keep upgrading their technology and investing more in safety and compliance.

DATA ANALYSIS AND INTERPRETATION

This part represents the analysis of the SBI digital banking users' data in Ranchi. Demographics charts, descriptive statistics, and various statistical tests support the analysis to understand customer trust and satisfaction.

Demographic Profile of Respondents



The demographic analysis indicates that the majority of the respondents belong to the 21-30 age group, followed by those below 20 years. Female respondents are more numerous compared to male respondents. When it comes to occupation, students form the largest group, followed by salaried and self-employed individuals. This indicates that young and technologically active users widely use digital banking.

SBI Digital Banking: Statistical Analysis Results

Descriptive Statistics

1.1. Table 2: Descriptive Statistics of Likert Items

Variable	n	mean	sd	median	skew	kurtosis
trust_erosion_n	120	2.917	0.904	3	-0.380	0.134
confidence_n	120	3.158	0.840	3	-0.385	0.741
reliability_n	120	3.283	0.791	3	-0.539	0.832
continuance_n	120	3.325	0.790	3	-0.533	0.495
infra_improve_n	120	3.342	0.845	3	-0.454	0.901

overall_sat_n	120	3.408	0.761	3	-0.145	0.699

The average scores of trusts, confidence, reliability, continuance intention, and overall satisfaction are around the middle value. This means most people feel okay or neutral about SBI digital banking services—not too happy, not too unhappy.

Survey Reliability (Cronbach's Alpha)

The survey scale demonstrated acceptable internal consistency for academic research (Cronbach’s α = 0.719).

DEMOGRAPHICS & BANKING ERRORS (Chi-Square Tests)

1.1. Table 4: Chi-Square Test Results

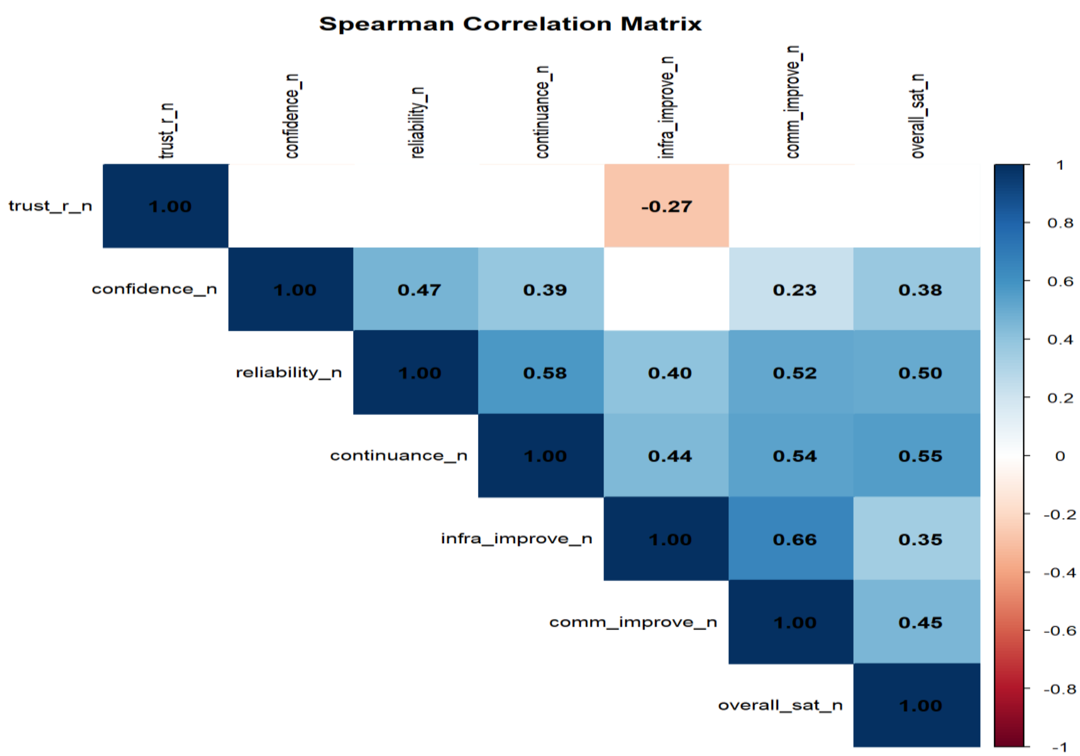
Comparison	Chi_Square	df	p_value	CramersV
Age × Error Faced	3.566	4	0.4679	0.172
Gender × Error Faced	0.895	2	0.6391	0.086
Occupation × Error Faced	5.911	4	0.2059	0.222

There is no statistically significant association between a user's demographic factors (age, gender, occupation) and whether they faced digital banking errors (all p-values > 0.05).

Differences between group (Kruskal-Wallis Tests)

Tests revealed no statistically significant differences in overall satisfaction across different occupations ($p = 0.143$), nor in trust across different age groups ($p = 0.088$), nor in confidence across genders ($p = 0.383$).

Correlation Analysis



The correlation analysis demonstrates the relationships between various parameters. It can be seen that when reliability and willingness to continue using the service increase, overall satisfaction also improves. Similarly, better infrastructure and communication are linked with higher satisfaction levels. On the other hand, trust tends to decrease when there are more issues, but improving service quality can help in reducing this loss of trust.

MAIN DRIVERS OF SATISFACTION (Ordered Logistic Regression)

An ordered logistic regression analysis was carried out to determine which factors actually predict overall satisfaction with SBI digital banking. The model revealed two statistically significant predictors:

Perceived Reliability ($p = 0.016$): For every one-unit increase in perceived reliability, the odds of a user reporting a higher level of overall satisfaction increased by a factor of 2.28.

Continuance Intention ($p < 0.001$): A one-unit increase in the intention to continue using the service multiplied the odds of higher satisfaction by a factor of 5.86.

FINDINGS

After carefully analyzing the data collected from SBI digital banking users in Ranchi, we can draw a number of significant conclusions from customer behavior, experiences, and trust:

- Most of those who have responded are young individuals, especially students and early professionals. This makes it quite evident that people who are comfortable with smartphones and online platforms are more likely to use digital banking. Younger users tend to rely more on mobile banking and UPI for their daily financial needs.
- A significant number of respondents reported facing digital banking issues such as transaction failures, delayed refunds, server errors, and app-related glitches. These problems are common and regularly affect the user experience for many customers.
- One interesting finding is that no specific group of people is associated with these errors. Whether it is age, gender, or occupation, everyone faces similar issues. This means that digital banking errors are system-related rather than user-specific.
- The overall perception of SBI digital banking services is moderate. Customers are somewhat satisfied, but not highly impressed. This shows that while the services are useful and convenient, there is still room for improvement in quality and consistency.

- A critical insight from the study is that reliability has a major influence on client satisfaction. Customers naturally increase their trust and satisfaction when they perceive the system functioning smoothly and successfully completing transactions.
- Another significant discovery pertains to continuance intention, which refers to customers' willingness to continue using the service. It was found that customers who continue to use digital banking regularly are generally more satisfied. This shows that repeated usage builds familiarity, comfort, and trust over time.
- Even though many users experience errors, these errors do not directly reduce overall satisfaction in a strong way. This suggests that customers are willing to adjust with occasional problems as long as the system works properly most of the time.

Overall, the findings show that customers focus more on the overall experience and reliability rather than isolated problems. They expect the system to work consistently, even if minor issues occur occasionally.

CONCLUSION

The purpose of this study was to learn how consumers feel about online banking, particularly when they face errors, focusing on SBI users in Ranchi. These days, online banking has become a part of everyday life. People use it for almost everything, like sending money, paying bills, checking balances, and many other daily transactions. Because of this, trust in digital banking is very important. If customers don’t trust the system, they will hesitate to use it.

From this study, it is clear that digital banking is widely used, especially by young people like students and working professionals. These users feel more at ease with mobile phones and online services, so they favor online banking over conventional methods. SBI has been successful in encouraging consumers to use its digital services, which shows how important digital platforms have become in today’s banking system.

Additionally, the study demonstrates that digital banking is not perfect. Many users have faced problems such as transaction failures, delays in refunds, server issues, or app errors. These issues are rather typical and are faced by all types of users, no matter their age, gender, or occupation. This indicates that these problems are associated with the system itself and not because of any specific group of users.

However, one intriguing aspect that comes out of this study is that these errors do not completely break customer trust. Most customers understand that small technical issues can happen. They don't judge the bank based on just one bad experience. Instead, they look at the overall performance of the service. If the system works properly most of the time, they are okay with occasional problems.

The study clearly shows that reliability is the most crucial element for customers. When the system works smoothly and transactions are completed without issues, consumers are more self-assured and satisfied. Reliability gives them a sense of security and trust. On the other hand, if the system keeps failing, even small issues can create doubt in the minds of customers.

Another important point is about continuance intention, which simply means whether customers want to keep using digital banking or not. The study shows that people who continue using digital banking regularly are more satisfied. This happens because with regular use, they become more familiar with the system and feel more comfortable. Over time, this builds trust.

It is also interesting to see that things like age, gender, occupation, or even the experience of errors do not directly affect satisfaction in a strong way. This indicates that consumers are not giving it much thought about who they are or what problem they faced once. They are more focused on how the system performs overall in the long run.

In simple words, customers do not expect digital banking to be perfect, but they do expect it to work properly most of the time. They are ready to adjust to small issues, but they want the system to be dependable. If they feel that the service is reliable, they will continue using it without hesitation.

The analysis comes to the conclusion that online banking errors affect customer trust. Trust plays a crucial role in the adoption and continued use of digital banking services **(Haider et al., 2024)**. System reliability is the most important factor influencing customer satisfaction and trust **(Choudhuri et al., 2024)**. At the same time, clear communication during errors is also very important. When customers know what is happening and when the issue will be solved, they feel less stressed and more confident.

Overall, this study tells us that customer trust in digital banking is built slowly over time. It depends more on consistent performance than on individual experiences. Even if customers face a few problems, they will continue to trust the system if it works well most of the time.

To conclude, digital banking errors are a part of the system, but they are not the biggest problem. What really matters is how reliable and smooth the service is. If banks like SBI focus on improving reliability and maintaining consistency, they can easily build strong customer trust and long-term satisfaction.

SUGGESTIONS/RECOMMENDATIONS

Based on the findings of this study, some practical and realistic suggestions can be given to improve SBI's digital banking services and strengthen customer trust:

- The bank should focus more on improving the reliability and stability of its digital platforms so that users can complete transactions smoothly without interruptions.
- Technical issues such as server downtime, transaction failures, and delayed refunds should be minimized, as these are the most common problems faced by users.
- The grievance redressal system should be made faster and more responsive. Customers should feel that their complaints are heard and resolved without unnecessary delays.
- Clear and timely communication should be provided during failed or delayed transactions. Even a simple update can reduce customer confusion and frustration.
- Regular updates and improvements in mobile banking applications can make them more user-friendly and efficient.
- SBI can also focus on building stronger customer trust by providing a safe and secure digital environment, especially regarding data protection and transaction safety.
- Customer feedback should be taken seriously and used as a tool for continuous improvement. Listening to real user experiences can help the bank improve its services in a practical way.
- Awareness programs can be carried out to instruct clients on how to utilize online banking safely and avoid common issues.

SCOPE FOR FUTURE RESEARCH

This study also opens up several opportunities for future research:

- Future studies can compare SBI with private banks to understand differences in service quality, trust, and customer satisfaction.

- Research can be extended to rural areas to study how digital banking is used in less developed regions and what challenges users face there.
- A larger sample size can be used to get more accurate and general results.
- Future research can focus specifically on different types of digital banking errors and study their direct impact in more detail.
- Advanced tools and techniques can be used to better understand customer behavior, trust, and decision-making pattern
