IMPACT OF ONLINE SHOPPING ON CONSUMER PREFERENCES: A STUDY OF BEHAVIOURAL SHIFTS, PLATFORM PREFERENCES, AND SATISFACTION LEVELS

Damini Singh, Kashish Gupta, Naman Agarwal - Research Scholars
Ms. Milan Singh - Assistant Professor
Dept. of Commerce & Management, Kalinga University, C.G.

ABSTRACT:

In today's world the number of consumers buying from the online shopping portals has rapidly increased which has in turn given a boost to product selection methods and has become much more efficient. Online shopping has become part of every consumer's life owing to its time, speed, variety and cost saving nature.

In this paper, an attempt is made to find out how online shopping affects consumer preferences with an empirical study by collecting primary data from 14 respondents. The data was collected with the help of a structured questionnaire and was analyzed by percentage and exploratory analysis by categories namely; experience, ease, spending, preference of site and method of payments and the satisfaction derived from the online purchasing. From the analysis of data it is found out that Myntra and Meesho is the preferred online site and clothes is the most purchased item online. Saving of time and cash discounts are the main factors while buying online. Quality issue remains a major barrier hence most of them spend a lot of time reading reviews and use cash on delivery as a safeguard measure. The number of respondents being so small hence the research is more of an indicative and exploratory rather than a concluding one. This study is helpful in gaining knowledge about consumer behavior trends in online shopping and identifies important factors that can be improved for the better customer experience.

Keywords: Online shopping, consumer preference, e-commerce, consumer behaviour, satisfaction, product quality.

1. Introduction

The swift development of e-commerce has brought about a revolution in the purchasing behavior of consumers. Due to the widespread use of the internet and mobile phones, online shopping is now an extremely popular option for purchasing items. Modern consumers are preferring online stores because of their convenience, easy access, range of options, and low prices.

“In India, the advancement in technologies related to computers and internet has increased the inclination towards online purchases among consumers. Young consumers like students have been lured by the ease of online shopping via digital platforms. Factors such as customer feedbacks, discounts, and home delivery have also impacted consumer behavior.”

“But at the same time, there are some problems which may come up with the phenomenon of online shopping as well. Some customers are struggling to obtain products which meet quality requirements,” have difficulties in delivery processes, and have online transaction issues. All these “problems are affecting consumer preferences and consumer satisfaction in general. This research paper will examine the effects of online shopping on consumer preferences. Such issues as the” choice of website, purchasing behavior, spending pattern, payment behavior, and consumers “preference would be studied. Primary data will be collected from 14 subjects. This research aims to analyze customer behavior on online websites, study consumer choice between different websites” and goods, factors contributing to customer purchasing, consumer spending behavior, and consumers satisfaction derived from online shopping.

“As the sample size is very small, and most of the sample consists of students, this research would take an explorative aspect, thus trends are analyzed but not used to derive general conclusion.”

2. Literature Review and Research Gap

“Much amount of academic research has been done on the influencing factors for the consumers during an e-commerce transaction. Scholars have found various economic, technological and psychological factors affect consumer choice on an online platform.” “Balachandar T (2024) conducted a thorough research on the consumer preferences while doing online shopping and main factors that make consumer choices for the online platforms”. “He found convenience has been an obvious factor in consumer decision, for it enables consumers choose online shopping where they are allowed to surf around without any constraints,” at any time and any place. In addition to that, variety of products also turns out to be another influential factor that consumers do choose and try on products that has a lot of brands/ categories and at different prices ranges.” Comparing of price has been another obvious factor, because consumers usually seek discount offers and want to gain optimal utility from their” money. The study also put more importance on the aspect of user experience in this sector, “consumers often have the inclination to select online sites which are not only aesthetically appealing but also user friendly to simplify their ordering and selection process.” “Similarly, another research work by Hema Malini (2019) was conducted with regards to the online buying behavior of the inhabitants in a Tier-II city. The research suggested that online shopping is prevalent in the society among young people and individuals who are educated”. It “was observed that younger individuals and highly educated individuals had a greater level of interaction with the technology and the use of online payment was clear to them. Hence, age and” education is a vital factor which affects the choice of online purchasing by individuals. It was “concluded from the research that young individuals are

fond of discovering new technology and variety of products and also used digital payment for everyday purposes. Thus, in order for the e-commerce industry to know which kind of customers to cater, it should know about the demographics of the society. An in-depth study was done by Tass Mudasir Ahmad (2024) and it has specifically investigated the ways how consumer perceptions can influence their purchasing behaviors online, taking into account psychological factors which influence consumer purchasing behaviors in an online environment". This study reported that one of the influential factors in influencing online "consumer purchasing decisions was security and trust. It is observed that when an online shopper has to input private details such as credit card number to perform online transactions, it

becomes very important for the shopper to know how much she/he can trust the web portal. Security perceptions (such as use of secure payment gateways, secured data transmission and privacy of given information) was also found to be influential in making online shoppers comfortable to perform online purchases. The trust factor was related to factors such as brand "name of the company, quality of services given by the web site and past consumers' feedback. As consumers found an online portal to be reliable, authentic and secure, they would more likely to finish purchasing process and continue visiting and purchasing. One of the researches done on the consumer's adoption of online shopping was by Baheti Vishakha(2016). This research focused on the significant determinants that affect the adoption" process of online shopping and concluded that convenience is the most influential factor. This "research showed that consumers are interested in online shopping mainly because it gets rid of the necessity of traveling to a brick and mortar store and allows consumers to buy things on their time. In addition to it, the home delivery service, comparison of prices of items, and the convenience" of searching, and more also attract the consumers for buying things online. The other findings were the difference in gender based preferences for goods when people buy from "e-commerce websites. Like, some people will choose to buy electronics, some will choose to buy apparel and so on. These factors influence the gender based preferences while shopping on" an e-commerce website. E-commerce firms should utilize these findings for marketing, because knowing customers' preferences is a very crucial part for any business in the e-commerce arena. A general study by Neella Bhargava (2018) was carried out and an attempt was made to determine the influence of new media over the consumer behavior as new media takes place at" the fastest pace of evolution in the developing age of internet. Through her study it was found "that new media plays an important role to influence consumer attitude, appraisal and hence purchase intention. Compared to the traditional media, new media offers content which is simultaneously real-time and exciting as well as interactive. A key finding from the study was the significant role that social media plays in influencing the consumer's attitude towards" products and services. Due to different networking sites such as facebook, instagram, twitter "consumers would often post about the product in order to gain or pass a comment regarding their experience about that particular product, which in turn could influence the others attitude" regarding the product. In the present time where traditional advertisement hardly influences the consumer, they opt for personal feedback, suggestions or opinion from the influences or peers of "their circle, which they believe would rather seem true and accurate. Online reviews were the other key feature that were observed through the research which provides the customer with useful feedback for the working and performance of the product thus decreasing the purchase risk for online buying. Khushboo Jain (2020) has carried out extensive research on online shopping behavior and the determinants of such behavior and finds there are many significant determinants that affect a customer's online shopping behavior." Convenience is considered one of the most significant factors since it allows customers to look at products at their most convenient time and place, "making the process easier and not location-based. The cost factor is also said to be "very significant in influencing customers' preference to engage in

online shopping; customers are always on the lookout for the website that can provide them with cheap products with special” discounts. The number of products available becomes another significant factor that drives “customers into online shopping as e-retailers have the ability to offer customers a comprehensive range of products. Trustworthiness becomes a significant aspect of this entire process because customers will engage in online shopping only if they are sure about the websites and the products. The researcher studied the social influence aspects and specifically social suggestion's effect on purchasing decisions of customers according to Mishra Rameshwar Kumar (2021).” This study found out that social suggestion and peer influence had now become a significant element while “influencing the purchase decisions of consumers. It is observable from the same that now consumers tend to more frequently make purchasing decision based on the experience and” suggestion of their peers, friends, family members and their social circles. Online shopping “platform provide immense scope to the consumers to have social suggestion related to products from numerous channels. It is seen that product review websites, rating websites, social media networks and so on acts as channels for obtaining social suggestion”. Consumers often believe more in such type of suggestions compared to conventional advertisements since these “suggestions are felt more authentic. Social input helps consumers to feel confident about certain products and eliminate uncertainty”. This factor is especially important when it comes to online shopping because customers do not see any physical samples of the products they plan to buy. Sini M G (2023) carried out a comparison of various e-commerce websites in an effort to determine the reasons why consumers make their choices regarding the platforms they prefer when shopping online. It was found that consumer preferences differ considerably depending on a number of demographic and economic factors as well as personal needs. One such factor is age, which plays an important role since different age categories demonstrate their own unique behavior, experience in using technology, and preferences regarding the goods they buy. “In general, young people are more prone to experimentation and discovery of new sites and brands as well as making different kinds of purchases through the Internet than old people with their” simpler and more trusted ways. Amount of money that a person possesses is another important “factor that helps choose a particular site and a particular product. Obviously, having money enables a person to both choose and purchase the goods and the channel through which they will be purchased.” Choice of the product itself can affect the website through which the purchase will be made. “There exist websites that are good for particular products, such as electronic goods and fashionable items, and where you can purchase certain products depending on their type. Impreet Kaur (2019) studied to analyses the consumer satisfaction in the process of shopping online i.e. the variables which are very important in affecting the level of satisfaction of the consumers in the process of shopping.” The study indicated that unsatisfactory experiences, particularly those arising from low quality products and late deliveries, play an important role in determining consumer satisfaction and subsequent purchasing decisions. Based on the results in the paper, it could be seen that if consumers' expectations are not met, in particular, it will be quality of the products and durability of the products, accuracy of the products information offered, customers will have an” untrustworthiness of online shopping websites. In particular, unmet customer expectation on quality leads to a sense of risks of online shopping with product quality for customers “and a sense of dissatisfaction of the risk. Late delivery can create huge frustration among consumers as they expect online shopping websites to have prompt delivery service.” In addition, the research showed that these kind of poor experiences lead to a negative “outcome of loyalty toward the company, negative word-of-mouth and reluctance to make further purchases”. In turn, on-time delivery and product quality are factors which help develop loyal customers relationship. Generally speaking, this study indicated that “commitment to

products standard and efficiency of logistics can lead to satisfy customers and sustain business-to-customers relationship. A research was done by Thummala Sudheer (2019), which focused on consumer perceptions towards online shopping, in order to study psychological and emotional factors that affect the purchasing behavior of online consumers. It was found that trust and emotional satisfaction play “a key role in affecting the perceptions of online consumers regarding online shopping websites. Trust is one of the basic factors.” The consumers are supposed to have trust in the website “regarding security, reliability, delivery, and so forth. This is about the safety of the payment system, the personal data protection, the true authenticity of the merchandise sold, and the trustworthiness of the seller. “Given trust, people will feel safe to buy something without hesitations, and develop a close relation to the company. Besides trust, emotional satisfaction” was also emphasized by the research study and is one significant factor contributing to shaping consumer's attitude toward the product or service. Shopping in the virtual world is not only an “operating procedure but an emotional one, consumers find pleasure, thrill, ease, and other happy feelings during the whole process.” This can increase consumer's emotional satisfaction and “attract customers coming back more frequently. According to the research study finding, it suggests that online retailers have to put much focus on the efficiency and pleasantness of the transaction process. The latter consists of trust and other pleasant feelings generated. Having emotional satisfaction is helpful to shape consumer's attitude to a certain brand positively.

The Research Gap

“The Research Gap However, while much work has been published on online purchasing and consumers' needs and demands, certain gaps still remain within the literature.” “A large majority of those studies conducted had a fairly high sample size; as well, many researches had been conducted in large metropolitan cities, with little attention devoted to small samples, with a specific concentration toward college students.” As such, young adult, and specifically college students', needs and demands have been somewhat neglected.

Additionally, although most of the studies examined one feature of consumers' preferences and behavior only (e.g., level of convenience, pricing, level of trust, etc.), very few papers explored the interaction of various features of consumers' preferences and behavior at once.

Furthermore, constant changes in the digital landscape and increased importance of mobile applications require new and up-to-date approaches for research in the field.

Thus, attempts are going to be made to bridge the existing gaps in the literature by exploring various aspects of consumers' behavior within a sample of college students.

3. Research Design and Model

“Research Design and Model Descriptive research design is used in this study, which is very helpful for understanding properties, characteristics and attitudes of the target population at a given point in time”. When conducting descriptive research, the primary purpose is description. “There is a need

for empirical observation, without researcher manipulation. It may be asserted that the main aim of the descriptive research is to describe phenomenon as it actually is. With reference to that, the descriptive research is of advantage to make the behavior of the consumers' precise. In this study the main research approach applied is quantitative approach". "Especially data in numerical format will be collected using survey method and after that statistical analysis (which is one of the quantitative method) will be adopted to analyzed data. This method corresponds with positivistic paradigm".

3.1 Sources of Data

3.1.1 Primary Data

The primary data used in this research was directly gathered from the participants through a structured questionnaire survey conducted using Google Forms. This tool enabled the gathering of data on a range of variables related to online purchasing and customer behavior, which include demographic variables, preferred platforms for online purchasing, preferred product categories, motivation factors, spending patterns, level of trust and satisfaction, preferred payment options, and online shopping behavior during the pandemic period.

3.1.2 Secondary Data

The secondary data was collected from academic journals, research papers, books, government documents, and industry-related magazines on topics such as e-commerce, consumer behavior, and online shopping. The secondary data served as the basis for the theory and helped in situating the primary data within the larger scope of academic literature, as mentioned in Chapter 2: Literature Review.

3.2 Sampling Design

3.2.1 Population

The target population in this research refers to people who have taken part in online shopping in the last six months. This includes the segment of consumers who are actively involved in online activities. The members of this population come from urban and semi-urban settings and represent various demographics such as students, working professionals, homemakers, and businessmen.

3.2.2 Sampling Method

The use of convenience sampling strategy in this case is evident in the way participants for the study were identified by their availability and willingness to take part in the survey process. Convenience sampling is commonly used in consumer research studies especially where time and resource constraints exist. The strategy although not suitable for representation purposes may still be used to generate directional insights into consumer behavior in online shopping scenarios.

3.2.3 Sample Size

The total number of responses received from the participants was 14, and all the responses were valid since there was no missing data in any of the questions posed to them. All the 14 participants answered all the questions posted to them, which resulted in a 100% response

completion rate. Although the sample size used was not large enough, it can serve well at a Pilot level where we get to analyze the spread of the answers based on the variables presented in the survey.

4. Data Analysis and Findings

This chapter provides an in-depth discussion on the data obtained from 14 participants. The results have been presented under four main headings, namely demographic data, online shopping patterns, reasons for purchasing and expenditure, and consumer attitudes and perceptions. An interpretation of the results follows each table.

4.1 Demographic Profile of Respondents

Table 2: Demographic Profile of Respondents (n = 14)

Variable	Category	No. of Respondents	Percentage (%)
Age Group	Below 20	2	14.3%
	20–30	12	85.7%
	31–45	0	0%
	Above 45	0	0%
	Total	14	100%
Gender	Male	3	21.4%
	Female	11	78.6%
	Total	14	100%
Education	School Level	0	0%
	Undergraduate	12	85.7%
	Postgraduate	1	7.1%
	Professional	1	7.1%
	Total	14	100%
Occupation	Student	13	92.9%
	Private Employee	1	7.1%
	Government/Business	0	0%
	Total	14	100%

Interpretation: The majority of the participants surveyed (85.7%) fall within the age bracket of 20 to 30 years, representing the generation that is mostly engaged in e-commerce activities in the country. The female gender dominates the sample population by accounting for 78.6% of all participants, confirming studies conducted that suggest the active engagement of women in online purchases especially when buying fashion and clothing items. Most participants in the survey have an educational background of undergraduate level, making up 85.7%.

4.2 Online Shopping Behaviour and Platform Preferences

Table 3: Online Shopping Experience and Platform Preference

Variable	Category	No. of Respondents	Percentage (%)
Shopping Experience	Less than 1 year	0	0%
	1–3 years	3	21.4%
	3–5 years	4	28.6%
	More than 5 years	7	50.0%
	Total	14	100%
Preferred Platform	Amazon	0	0%
	Flipkart	2	14.3%
	Myntra	7	50.0%
	Meesho	5	35.7%
	Total	14	100%
Product Category	Clothing	12	85.7%
	Electronics	0	0%
	Groceries	0	0%
	Others	2	14.3%
	Total	14	100%

Finding 1: Most of the survey participants have considerable experience when it comes to shopping online. 50% of the participants have already been shopping online for over five years,

while all other participants have at least one year of experience. Therefore, it can be assumed that the respondents are mature enough and have stable preferences regarding the online shopping process.

Finding 2: Myntra and Meesho enjoy dominance in terms of platform preferences. Myntra enjoys the highest percentage of platform preferences (50%) while Meesho occupies second position at (35.7%) followed by Flipkart (14.3%). Amazon enjoys 0% of platform preferences. The dominance enjoyed by Myntra and Meesho is closely related to the profile of the sample because the primary interest of young female students lies in purchasing fashionable clothes at low costs and this is exactly what these platforms offer.

Finding 3: Clothing is the most purchased product category. 85.7 percent of the participants buy their clothes from online stores. It fits perfectly into their choice of platforms. The participants who have restricted finances seek fashionable and cheap clothes from online sources, and that is why they prefer fashion platforms.

4.3 Purchase Motivations and Spending Patterns

Table 4: Purchase Motivations and Spending Behaviour

Variable	Category	No. of Respondents	Percentage (%)
Primary Motivation	Saves Time	6	42.9%
	Discount / Offers	4	28.6%
	Wide Product Variety	2	14.3%
	Convenience / Easy Access	2	14.3%
	Total	14	100%
Monthly Spending	Below ₹1,000	7	50.0%
	₹1,000–₹2,500	4	28.6%
	₹2,500–₹5,000	2	14.3%
	More than ₹5,000	1	7.1%
	Total	14	100%
Payment Method	PayPal	0	0%
	Cash on Delivery (COD)	7	50.0%
	Credit/Debit Card	0	0%

Variable	Category	No. of Respondents	Percentage (%)
	UPI	7	50.0%
	Total	14	100%

Finding 4: Saving time is the most significant factor for e-commerce. 42.9% of the respondents revealed that saving time is the major incentive to buy things online. Discounts and offers ranked second with 28.6%, whereas diversity of products and convenience both had the same score of 14.3%. It is evident that the two most important appeals of e-commerce are saving time and money. This is precisely what counts most to students who are always occupied and on a budget.

Finding 5: Most respondents have a low monthly spending budget. 50% of the surveyed people spend less than ₹1,000 per month while 28.6% people have their spending range between ₹1,000 to ₹2,500. However, only 7.1% have their spending range more than ₹5,000 per month. This clearly states that students buy things from the internet quite frequently and yet they do so keeping the budget in mind.

Finding 6: Cash on Delivery and UPI are equally preferred at 50% each. Despite their digital literacy skills, 50% of the participants have still favored COD mode of payments. This is a highly significant result for the research, meaning that despite being technologically savvy, customers are concerned about the quality of the product that would be delivered and fear mismatches with the product advertised in the online store. Thus, COD works as an extra measure of security for them in case something goes wrong with the order; in this case, the buyer may simply refuse to pay. The popularity of UPI mode is also equally distributed (50%).

4.4 Consumer Attitudes and Perceptions

Table 5: Delivery Importance — Mean Score Analysis

Response	No. of Respondents	Percentage (%)	Score
Strongly Agree	8	57.1%	5
Agree	5	35.7%	4
Neutral	1	7.1%	3
Disagree	0	0%	2
Strongly Disagree	0	0%	1
Total / Mean Score	14	100%	4.50

Interpretation: The mean value of 4.50/5 proves that speedy deliveries are highly valued by online buyers. The aggregate 92.8% value reflects how many participants agreed and strongly agreed about the importance of speedy deliveries. This result proves that speedy deliveries are more than just an additional service but a prerequisite for online consumers of today. Websites that constantly miss the deadline will soon lose consumers' preferences.

Table 6: Consumer Attitudes Summary

Question / Variable	Key Finding	Percentage / Score
Reading reviews before purchase	of respondents always read reviews before buying	14/14 = 100%
Comfort level with online buying	ents comfortable — none uncomfortable	14/14 = 100%
Usage during COVID-19 pandemic	espondents actively shopped online during pandemic	14/14 = 100%
Pandemic shopping frequency	opped weekly; 35.7% shopped multiple times/month	85.7% very active
Biggest concern	f product quality is top concern	10/14 = 71.4%
Overall satisfaction rating	xperience as Good or Excellent	12/14 = 85.7%
Top barrier to purchase	not find products (42.9%) + Shipping costs (35.7%)	11/14 = 78.6%

Finding 7: All 100% of respondents read product reviews before buying. This is the most important discovery of the whole research. All 14 participants agreed that they always check the product reviews before purchasing the item online. The buyer can directly test the product when visiting a shop physically. However, it is impossible to test a product online. Therefore, people rely on the opinions of other buyers who have purchased the product. Product reviews have fully substituted for physical testing of products.

Finding 8: Product quality uncertainty is the biggest concern for 71.4% of respondents. The primary problem cited by 71.4% of the people when shopping online was the uncertainty of the quality of the goods purchased compared to the description of the item on the website. The inability to verify the quality of the item purchased is the reason for two other key behaviors: 100% of shoppers reading reviews (Conclusion 7), and 50% of shoppers preferring Cash-On-Delivery purchases (Conclusion 6). Together, the three conclusions paint a complete picture that can be summed up in one statement.

Finding 9: Overall satisfaction is high despite quality concerns. Despite the concern with regard to the quality of the products being sold, 85.7% of the respondents gave the experience an excellent rating, either Good or Excellent, and none of the respondents rated their shopping experience Poor or Very Poor. This indicates that although there is genuine concern about the quality of the product, the advantages associated with shopping online far outweigh the disadvantages.

Finding 10: The COVID-19 pandemic made all respondents active online shoppers. The percentage of active online buyers was 100%. The frequency of shopping was 50% on a weekly basis and 35.7% more than once monthly. This shows that the pandemic had resulted in the transformation of shopping habits permanently. Moreover, for the students, the habit of buying things online is something which has become part of their daily routine.

Summary of Findings

It has been found that younger Indian students have grown into competent and frequent shoppers online. These students tend to use affordable websites like Myntra and Meesho and mostly buy clothes from them. Time-saving emerges as their main reason for using these websites, and they tend to stay within a monthly budget while making purchases. Prior to making a purchase, they depend on product reviews extensively.

Nevertheless, the most worrying issue among consumers is that there is no guarantee regarding product quality since they cannot see the products they will be purchasing. Even then, consumers find online shopping convenient and satisfying because of its advantages including convenience, product variety, competitive pricing, and product delivery at the doorstep. Online shopping has gained popularity because of the ongoing coronavirus pandemic and has become a constant phenomenon post-COVID-19.

5. Limitations of the Study

Each research work has some limitations that affect the scope of applicability of its conclusions.

Among the limitations of the current research are:

- “The research has used a rather small number of respondents – only 14 participants were involved in the research”.
- The sampling technique applied in this case is convenience sampling, which can lead to bias and cannot give an overall representation of consumer preferences.
- “Most of the respondents were students, and this implies that there was no diversity among age, income levels, and occupations of respondents”.
- It should be noted that the findings cannot be generalized because the study involved a certain type of consumer.
- “Since the study involves self-reported data, one may conclude that the data gathered is

somehow distorted due to many reasons”.

The research lasted for a short time, implying that the trend in consumer behavior was changing during this period. Only certain factors influencing consumer behavior were taken into account in this study, whereas others might not have been considered.

6. Conclusion and Future Scope

6.1 Conclusion

According to the research done on Online Shopping and Consumer Preferences, online shopping has made a remarkable impact on the buying behavior of younger people in India. “14 respondents, who are college going girls in their undergraduate years generally, stated that buying online has been the most preferred option for all shopping”.

“They primarily shop online for clothes and accessories. From the responses it can be understood that convenient and time saving, as well as discounted offers are factors for online shopping's” increased popularity. Online shops such as Myntra and Meesho are very popular among the online “consumers because the variety of goods and offers at a low cost is very convenient. Further, consumers also tend to utilize customer reviews when shopping online. However another significant problem detected from the survey is the quality of product information uncertainty”.

“This factor highly affects consumers' choices making them go for a less risky approach in shopping online such as through utilizing reviews before they purchase and opting for Cash on Delivery rather than pre-paid schemes. Holistically the survey illustrates how shopping online has evolved from the merely convenient option to that influenced by trust and User Interface and Experience”.

“It is necessary to be aware that in order to develop consumer trust all that is needed is quality product information, a trustworthy delivery service and the presence of reliable payment services. While discounted offers would help to draw customers the element of trust is essential to retain customers.”

In conclusion, online shopping is firmly established among young consumers, but sustained growth and loyalty depend on reducing quality uncertainty and improving overall reliability of e-commerce platforms.

6.2 Future Scope

“Various aspects for further research have been identified through the current study on online shopping and consumer preference. Another study that can be performed is one that uses a greater number and variety of respondents, “seeing as how this study used a small number of respondents for its survey”. Another area that can be investigated is how the different” demographics of the respondents affect their purchases, “such as when they belong to different age groups and professions, or are based in different geographic locations”.

“This research will give us information on how the buying behavior of the respondents differs depending on whether they belong to the rural or urban areas, and come from different socioeconomic backgrounds”. Finally, given the rise in online shopping in India, an area of investigation can be on how technology and deliveries have affected their purchase preferences.
