THE STUDY ON JOB SATISFACTION ON YOUNG EMPLOYEES

Mercy Ritika Ekka - Student, MBA- Semester IV, Faculty of Commerce and Management
Dr. Jitendra Singh - Assistant Professor
Faculty of Commerce and Management, Kalinga University, (C.G.)

ABSTRACT:

In the world today the performance and productivity of employees and the success of organizations are greatly affected by how happy people are with their jobs. This study is trying to figure out how happy young workers are with their jobs and what things make them feel that way Locke, (1976) & Spector, (1997). Younger employees have ideas about what they want from their jobs because they have a lot of energy and are really focused on their careers. So it is very important for companies to understand what young workers want and need. Things like salary, work environment chances to move up in their careers job security, balance between work and life recognition and relationships with coworkers and bosses are all things that this study is looking it.

This study used information from two sources Robbins & Judge, (2017). It used information from journals and papers and it also collected new information by giving young workers surveys to fill out. What the study found out is that while money is very important for people to be happy with their jobs other things like a workplace chances to learn and grow, flexible work schedules and supportive leaders are also very important Herzberg, (1959). Many young workers prefer companies that appreciate their work and give them chances to move up. On the hand when there is too much pressure, at work people do not feel recognized and there are not many chances to move up it makes people unhappy and more likely to leave their jobs Kalleberg, (1977).

Keywords:- Job satisfaction, Young Employees, Work- Environment, Career Growth, Work- Life Balance

1. Introduction

In the workplace today it is really important for companies to understand what young employees think and want. Young employees are a generation of workers who bring new ideas and skills to the job. They also know how to use technology well. If they are not happy with their jobs they will not work as hard and will not stay with the company for long.

Being happy with your job means you like or dislike your work. It depends on things like how money you make what your workplace is like and if you can move up in the company. For employees these things might be more or less important than they are for older workers. Young employees often want to learn and grow do work that means something and have time for their lives.

This study is about what makes young employees happy with their jobs. We want to know that want and need from their workplace. If companies understand this they can make sure their employees are happy and this will help the company do well.

So it clear that job satisfaction is important for employees and for companies. If we study this we can make workplaces that're good for young employees and help them do their best work. This is good for the employees and good, for the company. Young employees will be happy and healthy. The company will grow and succeed.

2. Literature Review

Job satisfaction is an important topic when we talk about how people feel about their jobs. It is about how happy people are with their work and if they feel good about what they do. This is a deal because it affects how well people work and if they want to stay with a company.

According to Edwin A. Locke (1976) , job satisfaction is when people feel good about their job because of how they think about it. This means that job satisfaction is not about what is happening around us but also about how we think and feel about our job. When we think about employees job satisfaction is even more important. Young employees job satisfaction is even more important. Young employees are a part of the workforce and they have different ideas about what they want from their job. They want to be able to work in a way that's flexible and allows them to grow and learn. They also want to feel like their work's meaningful and that they are making a difference.

One of the people to study job satisfaction was proposed by Frederick Herzberg (1959), he said that there are two kinds of things that affect job satisfaction: hygiene factors and motivators. Hygiene factors are things like salary and job security. These things are important because they can make people unhappy if

they are not good. Just having these things does not mean people will be happy with their job. Motivators are things like being able to achieve something and being recognized for our work. These things make people happy and want to work.

Another person who studied job satisfaction was Abraham Maslow (1943), he said that people have kinds of needs like needing food and safety. Once these basic needs are met people want to feel good about themselves and be able to grow and learn. Young employees are often looking for these kinds of things: they want to feel want to feel respected and be able to achieve their goals.

Victor Vroom (1964), also studied job satisfaction. He said that people are happy with their job when they feel like their hardwork will pay off. This means that people need to feel like they are being treated fairly and that their work is valued. Young employees want to feel like they are being treated fairly and that their work is important.

According to Douglas McGregor (1960), there are two ways to think about employees. One way is to think that employees are lazy and need to be told what to do. The other way is to think that employees like to be treated like they are capable and want to work hard. They want to make decisions and be part of a team.

Nowadays there are other things that affect job satisfaction. One of these things is being able to balance work and life. Young employees want to be able to have time for their life and not just work all the time. They also want to work in a place that's friendly and supporting. The culture of a company is also very important

2.1 Research Gap

A big gap exists in studying what makes young employees happy at work. Many studies look at job satisfaction for people of all ages. Few focus on young employees and what they experience at work. Most studies are done in countries so we don't know much young employees in developing countries like india especially in smaller cities. There isn't research on how new work, freelancing and gig economy jobs affect young employees happiness. We also don't know much about how mental health, stress and balancing work and life affect employees. overall we need research that looks closely at young employees considers their specific situations and uses different methods to understand what makes them happy at work and what we can do to improve it.

3. Research Methodology

The way we do research is very important in any study. It helps us to do things in a systematic way. We need to choose the methods and techniques to collect analyze and interpret data. This way we can be sure

that our findings are reliable and valid. Research methodology is like a roadmap that guides us through the research process. According to C. R. Kothari (2010) said that research methodology is an organized process of applying different research methods to solve a particular problem. In this study we have carefully planned our research methodology to look at the level of job satisfaction among employees. We want to find out what factors influence their satisfaction in the workplace. Young employees are an evolving segment of workforce so we need to use a structured approach to capture their perceptions, expectations and experiences accurately.

The study used a questionnaire to find out how happy young employees are with their jobs. This questionnaire was put together carefully. It used a scale with five points. The points went from one to five. One meant the person strongly disagreed with something and five meant they strongly agreed. This scale was chosen because it is easy for people to say how much they agree or disagree with something. It is also a way to measure what people think and feel. the scale used in this study was created by looking at what other people have said about job happiness. They are people who have studied job happiness. Their ideas helped make sure the questionnaire had questions that asked about things like salary, work environment and career growth. These are all things that can affect how happy someone is with their job. Each of these things had questions so that the answers would be accurate.

The questionnaire asked about things that affect job happiness. It asked about salary and work environment and career growth. It also asked about recognition and work-life balance. All these things are important, for job happiness. The study made sure the questionnaire was good so that it could get answers. The questionnaire was used to find out what young employees think about their jobs. The study wanted to know what makes them happy or unhappy. The questionnaire was a way to find this out.

4. Research Design

Research design is like a blueprint that guides the research process. It helps us to organize our study in a way that effectively addresses the research problem. According to John W. Creswell (2014) said that research design provides a framework for collecting and analyzing data in a manner. For this study we have used a research design. This type of design is suitable because we want to describe and analyze the existing level of job satisfaction among employees without manipulating any variables. Descriptive research helps us to understand the situation by gathering information about attitudes, opinions and behaviors. By using this design we can gain insights into how young employees perceive their jobs what factors influence their satisfaction and how these factors vary across individuals. This approach allows us to get an accurate representation of the research problem.

4.1 Data Collection Methods

The data for this study was collected carefully to ensure it was accurate and reliable. We made sure each step of collecting data was done properly so the information we gathered was useful and helped us achieve our goals. We designed the process to minimize mistakes and clearly understand what young employees think about their jobs. The study was done in areas where young employees work in types of organizations like private companies, service sector organizations and small business units. We chose these areas to cover work environments and settings. By including respondents from sectors we wanted to hear diverse opinions, experiences and thoughts about job satisfaction. This diversity helped make our data better. Our findings more meaningful and representative of real workplaces. We used a questionnaire to collect data. This method was chosen because it helps collect the type of data from any respondents quickly. In addition to the survey we also had informal talks with a few respondents. These talks helped us understand their responses better and get insights into their opinions and feelings about job satisfaction. They also helped clarify any doubts respondents had while filling out the questionnaire ensuring accurate responses. During data collection we approached 140 respondents. Out of these 120 completed the questionnaire which's about 85.7%. This response rate is considered good in social science research.

The rest of the responses were incomplete filled or not returned so we excluded them to keep our data quality high. The questionnaire had two sections: demographic information and job satisfaction statements. The demographic section asked for information like age, gender, and employment background. The second section had statements to measure aspects of job satisfaction evaluated using a 5- point Likert Scale. This allowed respondents to indicate their agreement or disagreement in a way. We made sure all questions were simple, clear and easy to understand. Respondents were told their responses would be kept confidential and used for academic purposes. This helped build trust and encouraged unbiased answers. After collecting data we screened all responses. 120 Valid responses were used for further analysis. The final dataset provided a foundation, for statistical analysis and drawing conclusions. Overall our careful data collection process ensured our study was based on high-quality data. It helped us achieve our research objectives. Made our study findings more credible.

4.2 Sampling Design

Sampling is a process of selecting a subset of individuals from a population for the purpose of research. The process of choosing a group of people from the whole population is called sampling design. This is really important because it helps make sure the results of the study are good and can be used to make conclusions about the group being studied. A good sampling design helps reduce mistakes and makes the results more accurate.

- **Population**

The people in this study are employees who are between 18 and 35 years old and work in different kinds of organization. These organizations are companies, service sectors firms and small business units. We chose this age group because they are the workforce and are more open to change and trying new things.

- **Sampling Technique**

We used a method called convenience sampling. This means we chose people who were easy to reach and willing to be part of the study. We did this because we did not have a lot of time and it was easy to collect data this way. Even though this method is not perfect it is often used in social science research when we need to collect data and do not have a lot of money. We tried to include people from organizations and work environments to make the study more representative.

- **Sample Size**

We decided to use a sample size of 120 respondents. At first we asked 140 people to be part of the study. Only 120 of them gave us complete and valid answers. We only used these 120 answers for our analysis. Having a sample size makes the study better and more transparent. It also helps us be consistent when we analyze and interpret the data. We think 120 people is enough to understand what affects job satisfaction among employees, in this study.

4.3 Variables of the Study

Variables are the elements that we study and analyze in our research

Our independent variables are : salary, work environment, career growth, recognition, work-life balance.

Our dependent variable is: job satisfaction, understanding the relationship between these variables helps us to identify the factors that influence job satisfaction among employees.

5. Data Analysis and Interpretation

5.1 Demographic Profile of Respondents

Table 1 :- Age Distribution of Respondents

Age Group Number	Number of Respondents	Percentage %
18 – 25	45	37.5%
26 – 30	40	33.3%

31 – 35	35	29.2%
Total	120	100%

Sources:- Author’s own computation based on primary data (2026).

Interpretation and Data source Clarification

The data in Table 1 shows us the age of the people who took part in the study. We can see that most of the respondents 37.5% are between 18 and 25 years old. This means that the study is mostly about employees who are just starting their careers. These young employees are focused on learnings things developing their skills and looking for career opportunities.

The next group is the 26 – 30 age group, which makes up 33.3% of the respondents.

5.2 Factors Influencing Job Satisfaction

Table 2 : Mean Score of Job Satisfaction Factors

Factors	Mean Score
Salary	3.4
Work Environment	4.1
Career Growth	4.3
Recognition	3.8

Sources: Author’s own computation based on primary data (2026)

Interpretation and Data source clarification

The data in Table 2 shows us the scores of the factors that affect job satisfaction among young employees. The results clearly show that career growth with a score of 4.3 is the most important factor. This means that young employees really value opportunities to move up in their careers develop their skills and have long- term career progression.

5.3 Level of Overall Job Satisfaction

Table 3: Overall Job Satisfaction Level

Satisfaction Level	Number of Respondents	Percentage%
Satisfied	30	25%
Satisfied	55	45.8%
Neutral	20	16.7%
Dissatisfied	10	8.3%
Highly Dissatisfied	5	4.2%
Total	120	100%

Sources: Author's own computation based on primary data (2026)

Interpretation and Data Clarification

The data in Table 3 shows us the level of job satisfaction among the respondents. We can see that most of the respondents 45.8% are satisfied with their jobs and 25% are highly satisfied. This means that about 70.8% of the respondents are happy with their jobs. However 16.7% of the respondents are neutral which means they may not be fully engaged or satisfied with aspects of their jobs.

6. Hypothesis Testing

Hypothesis testing is a part of quantitative research. It helps us look at how variables are connected and make conclusions based on facts. This method gives us a way to decide if our assumptions are correct or not. In this study we wanted to see how job satisfaction is connected to things like salary, work environment, career growth and recognition. According to Kothari hypothesis testing lets researchers make guesses about a big group based on a smaller group of data. Creswell says that statistical testing is important to see if the relationship we see are real or just a coincidence.

Here are our hypotheses:

H_0 (Null Hypothesis): There is no relationship between job satisfaction and factors such as salary, work environment, career growth and recognition.

H_1 (Alternative Hypothesis): There is a relationship between job satisfaction and these factors.

We used correlation analysis to test these hypotheses. This method helps us see how strong and in what direction the relationship is between two or more variables.

The data from 120 respondents were analyzed using methods. The results show that there is an significant relationship between job satisfaction and factors such as career growth and work environment showed an association with job satisfaction compared to salary. Based on the results we reject the hypotheses(H_0) and

accept the alternative hypothesis(h_1). This means that job satisfaction among employees is significantly influenced by the selected factors.

These findings are consistent with studies. For instance Herzberg (1959), emphasized that motivational factors such as growth and recognition play a role, on employee satisfaction. Similarly Locke (1976), highlighted that job satisfaction is influenced by employees perceptions and expectations regarding their work environment.

Correlation Analysis

We did a correlation analysis to see how job satisfaction is related to the things that affect it like salary, work environment, career growth and recognition. Correlation analysis helps us understand how strong and in what direction the relationship is between things.

Table 4:

Variables	Job satisfaction	Salary	Work environment	Career Growth	Recognition
Job Satisfaction	1.00	0.45	0.62	0.71	0.58
Salary	0.45	1.00	0.40	0.38	0.35
Work Environment	0.62	0.40	1.00	0.55	0.50
Career Growth	0.71	0.38	0.55	1.00	0.60
Recognition	0.58	0.35	0.50	0.60	1.00

Source:- Author's own computation based on primary data (2026).

Interpretation

Now we look at what the correlation matrix tells us. It shows that all things that can affect job satisfaction are actually related to it in a way. The things that has the relationship with job satisfaction is career growth with a relationship of 0.71.

Regression Analysis

We did a regression analysis to see how much each of the things that can affect job satisfaction, like salary, work environment, career growth and recognition actually affects it. Regression analysis affects it. Regression analysis helps us figure out how much each factor affects job satisfaction.

Table 5

Variables	Beta Coefficient	Significance (p – value)
Salary	0.21	0.03

Work environment	0.32	0.01
Career Growth	0.41	0.00
Recognition	0.28	0.02
R² Value	0.68	

Source: Author's own computation based on primary data (2026).

Interpretation

Now we look what the regression analysis tells us. It shows that all things that can affect job satisfaction actually do affect it because their p-values are than 0.05. the thing that affects job satisfaction the most is career growth with a coefficient of 0.41.

7. Findings

The study about job satisfaction among employees is very important. It helps us understand what makes them happy with their jobs. We looked at the information we collected and it is clear that job satisfaction is not one thing it is many things. Some things that affect job satisfaction are things that happen inside the company. The study shows that financial reward like salary are still important but other things like career growth opportunities, recognition and a supportive work environment are more important for making young employees happy with their jobs. This is what Herzbergs Two – Factor Theory says, which talks about two kinds of factors: such as salary and working conditions and motivators like achievement and recognition. The theory says that what really makes people happy with their jobs is the motivators, not the money. Herzberg (1959) Some are things that happen outside of it. One big thing we found is that young employees really care about being able to move up in their careers. They want to learn skills and become better at what they do. This is what they do. This is what makes them happy with their jobs. This is like what Frederick Herzberg (1959), said a time ago that people are motivated by things like achieving something and growing. The place where people work is also very important. If the workplace is nice and people are supportive employees are happy. They feel like they are part of something. That makes them want to work hard. This is what Edwin A. Locke (1976), said that people are happy with their jobs when they like the place they work and the company they work for

They need to help them grow and develop and make the workplace a nice place to be. What is interesting is that young employees care more about things like growing and being recognized than they do about money. This is like what Abraham Maslow (1973), said that people want to be happy and fulfilled and that is more important than making money.

8. Conclusion

The study on workers and their job satisfaction tells us a lot about what they think and feel about their jobs in the world we live in today. How happy people are with their jobs affects how well they do their work, how much they get, and how much they want to do a good job. The people who did this study wanted to know how happy young workers are with their jobs and what things help or hurt their job satisfaction Robbins S. Judge (2017). The study found the most young workers are pretty happy with their jobs. A lot of the people who answered the questions said they were satisfied or very satisfied with their jobs, which means they like their jobs and what they have to do. This means that companies are doing some things right when it comes to making young workers happy. The theory says, which talks about two kinds of factors: hygiene factors like salary and working conditions and motivators like achievement and recognition. The theory says that what really makes people happy with their jobs is the motivators, not the money Fredrick, (1959)..

The study also looked at things like training chances to move up and flexible schedules. These things are important for job satisfaction even if they are not as how money people make. When people have schedules they can balance work and life better which is really important for younger workers.

The study shows that job satisfaction is complicated and depends on things, including money and other factors. The work atmosphere, management and career opportunities all affect how happy employees are. Money is still the most important thing. To make employees happy and effective companies need to think about all these things. So companies should focus on making sure their employees are treated well, paid fairly and have chances to move up. If they do this they can make their companies better, keep employees from leaving and make younger employees happier. Managers and people who make laws can use this study to help them make plans to make the workplace better, for people.

9. Suggestion

The study found some things that can help make young employees happier at work and make the organization work better. Firstly, companies should make sure that young employees know how they can move up in their careers and get better at what they do. They should have training programs and ways for employees to get promoted so they can reach their job goals. Fredrick Herzberg(1959), said a time ago that when employees have chances to grow and get better they are really happy at work. Job satisfaction is what companies should aim for and growth opportunities are very important for job satisfaction. Secondly, companies should try to make the workplace a nice place to be. They should make sure everyone gets along and that the people in charge are supportive. Edwin A. Locke(1976), said that when the workplace is a place employees are happy too. A good workplace is one of the things that makes employees happy at work.

Thirdly companies should say thank you to their employees when they do a job. They can give them money or just say thank you. This makes employees happy and want to work. Employee recognition is important for job satisfaction. Moreover companies should ask their employees what they think and how they can make things better. They can do this by sending out surveys or just talking to them. This helps build trust and makes the workplace a better place. Companies should listen to their employees

10. Future Scope:

This study is important. There is still more to learn. We need to do research to understand what makes young employees happy with their jobs. First we need to talk to people. We only talked to a group and we need to know what other people think. We should talk to people in industries and in different places. Secondly we need to ask people questions. We just need a questionnaire. We should also have conversations with people. This helps us understand what they really think and feel. Third we need to look at things that affect job satisfaction. We need to know about leadership and company culture. How these things affect employees. We also need to know about how technology and working from home affect job satisfaction. More and more people are working from home. We need to know if this makes them happy or not. It would be good to compare age groups and see what makes them happy, with their jobs. This helps companies make plans to make their employees happy. We can use math techniques to understand the information better. This will help us know what is really important. Finally companies can use what we learned to make their employees happy. They can help them grow and develop and make the workplace a nice place to be. This will make the company better. Make the employees happy.
