IMPACT OF HUMAN RESOURCE MANAGEMENT ON PRODUCTIVITY IN THE PHARMACEUTICAL INDUSTRY

Piyush Banjare - Mba Student, Department Of Management, Raipur, Chhattisgarh
Dr. R Shridhar - Vice Chancellor, Kalinga University, Raipur, Chhattisgarh

ABSTRACT:

In highly controlled and knowledge-based industry like the pharmaceutical sector, human resource management plays crucial strategic position with pro influence on productivity of pharmaceuticals organization. "This review article is based on the secondary data of the academic reports, industry reports and research papers to find the effect of different practices of HRM on Productivity. It covers a lot of HRM concepts like recruitment and selection, training and development, performance appraisal, reimbursement and motivation, involvement, leadership and organisational culture. This study shows that the HRM practices improve employee performance, innovation and organizational efficiency which directly increase the overall productivity on pharmaceutical industry." The study also finds several challenges to achieving the best performance, such as skill shortages, staff performance, technology adoption, and regulatory burden. The study concludes by emphasizing the need to intensive and strategically integrate human resource management practices and procedures into the pharmaceutical sector.

Keywords: Pharmaceutical Industry, Employee Performance, Human Resource Management, Productivity, Training and Development, Organizational Efficiency.

1. Introduction

Pharmaceutical sector is very important component of the international healthcare sector, like “helping to bring life-saving medicines or drugs and medical supplies to the market, as well as helping to develop and produce them”. “It is a very regulated and research-based industry, where precision, innovation, and productivity are important. In the complex environment, productivity is taking an important part of the success of an organization.” Human resource management is as important for improving productivity as capital investment and technology upgrading.

Human Resource Management (HRM) “has developed over the years from a bureaucratic function to a strategic function that influences the performance of the organization.” “In the pharmaceutical industry, where the workers need to have specialisation knowledge & technical expertise, HRM play a Crucial role to guarantee that the Staff has the ability & self-driven in the line with the industry achievements.” The administration of human resources also provides innovation and compliance with the regulation from operational efficiency.

The pharmaceutical industry has multiple loops and the productivity is not just reflected in the number of products produced, but also in other calculation like excellence, creativity, compliance, timely delivery etc. these factors are influenced by HRM practices as the can make impact employee behaviors, skill development and positive work culture or environment. Performance based incentives increase encourage staff to work more effectively. Structured training programs motivate staff to stay up to date with technology advancement.

For some few years we have seen more challenges in the management of the pharmaceutical organization workforce, especially related to globalization and digital change. The organizations operate in many numbers of markets, at the same time we going through the process of meeting a number of regulatory regimes and adjusting to rapid technological change. In response to this matter, HRM has grown into a strategic tool to increase an adaptable and flexible workforce that meets these needs.

These review article aims to analyses the impact of HRM practices on productivity in the pharmaceutical sector through a review of the research and identifies of relevant trends, challenges and opportunities. This study gives a look into how businesses can dive productivity through effective management of their human resources.

2. Literature Review

This review article gives to access the effect of HRM practices on the productivity of the pharmaceutical sector. This literature review gives the highlights on the major trends, challenges and opportunities. The report is a guide on how to increase productivity through good human resource management in the companies

This literature review suggests that the HRM is a strategic function that links human resources with organizational objectives and not just administrative works. the strategic management of human resources (HRM) is the concept that emphasises the importance of aligning HR policies with the business strategy for good performance and competition advantage. Businesses that have strategic human resource management have a better chance of seeing an increase in productivity and efficiency.

“Recruitment and selection are generally accepted as the good practice of successful HRM. Recruitment is a big process in pharma industry as it needs highly skilled people like scientists, quality control professionals and researchers. The pharma sector has been identified to invest in employee’s development

to gain higher productivity, fewer mistakes and more capacity to innovate.” The workshops, the on-the-job training courses are all the tools, which are essential for improving the skills.

Moreover, performance evaluation systems are affecting employee productivity and behaviour to a large extent. “Well-designed appraisal systems provide ongoing feedback, clear performance goals and areas for development. These procedures are more common to be seen as transparent and fair and will lead to higher engagement and motivation among employees.” The poor use of appraisal methods can lead to poor performance and dissatisfaction.

HR management influences retention and engagement of workers. Other aspects of HRM are compensation and reward systems. Both monetary and non-monetary reward contribute to productivity and satisfaction in the workplace. Competitive pay schemes, bonuses and recognition schemes can be used to attract and retain skilled workers in an organisation. It is a highly specialised pharmaceutical industries, so it is important to have steady and productive employees and for that it is necessary to have effective compensation plans. The key role on productivity in pharmaceutical sector is employee engagement. Happy workers are engaged, creative and willing to do whatever it takes. Employee engagement is based on Human Resource policies such as work life balance programs, good communication and recognition.

Productivity also depends on organizational culture and leadership. The transformational leadership involves inspirational and motivational leadership of staff has same linked that is better performance, motivation and innovation. “HRM procedures work better when positive culture at the pharma companies promotes teamwork, trust and continuous improvement.”

“HRM process has undergone significant changes with the benefit of technology, based on data analytics, digital tools and automation instead of traditional methods. That technologies provide important data for decision making and improve the work of the process of hiring, training and performance management.” Hence, workers should be continuously learning new skills, thereby underlining the importance of HRM to adapt to technological change. Productivity is also greatly influenced by the culture of the organization and its leadership. Leadership that is more performance and innovation orientated has been linked to high levels of transformational leadership which is characterised by inspiring and motivating staff. Corporate culture is good and teamwork, trust and continuous improvement to improve effectiveness of HRM process.

This literature highlights various problems i.e. skill gaps, employee turnover, regulatory demands and resistance to change, the benefits of HRM where need for companies to adopt flexible and innovation HRM approaches.

3. Research Methodology

This research methodology is the data of all the academic research and comes with a systematic approach for collecting, studying and interpreting the data to reach the research result. It ensures logical, systematic and scientific reliability of the study. Thus, the present study is intended to explore the effect of Human Resource Management (HRM) practices on the productivity in the pharmaceutical industry and needs a well-designed methodology for obtaining reliable and better results.

This study adopts a qualitative and analytical-descriptive research approach because its primary objective is to explore and understand the concepts, relationships, and patterns associated with Human Resource Management (HRM) practices and their impact on employee productivity. Rather than relying on numerical data and statistical analysis, the research focuses on gaining deeper insights through the examination of

existing literature and scholarly perspectives. The qualitative approach allows for a comprehensive understanding of how different HRM practices influence organizational outcomes, while the analytical-descriptive method helps in critically evaluating, interpreting, and synthesizing information gathered from previous studies. Since the research is based on secondary sources rather than primary data collection, this methodology is particularly suitable for identifying key themes, comparing findings, and developing a well-rounded understanding of the subject area.

3.1 Research Design

This study used a descriptive and analytical research design. The descriptive component entails carefully detailing a variety of HRM procedures, including hiring and selection, training and development, performance evaluation, reward schemes, and employee engagement. It offers a thorough detailed of how these procedures are applied in the pharmaceutical sector.

Examining the connection between HRM practices and productivity is the main goal of the research design's analytical component. It involves doing a critical analysing of the body of current literature to detect trends, parallels, and discrepancies in the results of different investigations. The study's depth and usefulness are increased by this dual method, which guarantees a balanced comprehension of theoretical ideas and practical applications.

3.2 Nature of the Study

This study is qualitative and interpretive. Because it uses non-numerical data from secondary sources, like textual information from books, reports, and research articles, it is qualitative. The study's exploratory component aids in understanding how HRM affects productivity, especially in a specialised sector like pharmaceuticals. Because the research is interpretative in nature, the researcher can use current information in order to analyse and explain the links between various factors.

Furthermore, there is no primary data collecting through surveys, interviews, or experiments because the study is solely reliant on secondary data. Rather, it makes use of already published data to gain a thorough grasp of the subject of the study.

3.3 Sources of Data

A variety of secondary sources were used to gather the data for this study, guaranteeing information diversity and dependability. Peer-reviewed academic journals, books on organisational behaviour and human resource management, industry reports, business periodicals, and reliable internet databases like Google Scholar, ResearchGate, and JSTOR are some examples of these sources.

Reports from international organisations, consultancy firms, and pharmaceutical corporations have also been used to comprehend HRM practices and industry trends. For information on regulatory frameworks and compliance requirements in the pharmaceutical industry, government publications and policy documents have also been consulted.

The use of multiple sources ensures that the study incorporates diverse perspectives and provides a comprehensive view of HRM practices and their impact on productivity.

3.4 Data Collection Procedure

To guarantee accuracy and relevance, the data collection procedure was methodical and controlled. The data collection process for this study was carried out in a systematic and organized manner to ensure that the information gathered was both relevant and reliable. Initially, key terms related to the research topic

were identified, including performance management, training and development, pharmaceutical industry, employee productivity, and human resource management. These keywords served as the basis for searching a variety of scholarly journals, academic databases, books, and professional publications.

After collecting potential sources, each publication was carefully reviewed to assess its relevance to the objectives of the study. Special attention was given to literature that examined the relationship between HRM practices and employee productivity, particularly within the pharmaceutical sector. The selected sources were then analyzed to identify key concepts, findings, and patterns that could contribute to a better understanding of the research topic.

To ensure the credibility and quality of the study, only reliable, peer-reviewed, and up-to-date sources were included in the review. Publications that were outdated, lacked academic rigor, or were not directly related to the research objectives were excluded. This careful selection process helped maintain the validity and integrity of the research while providing a strong foundation for the analysis and discussion of findings.

3.5 Data Analysis Method

The main technique used in the study to analyse the data gathered is qualitative content analysis. The data collected for this study was analyzed using qualitative content analysis, a method that focuses on identifying and interpreting patterns, themes, and relationships within textual information. “This approach was considered appropriate because the research is based on the review of existing literature rather than the collection of primary numerical data.” “The analysis was carried out in a structured manner to ensure a comprehensive understanding of the findings presented in the selected sources.”

The first stage involved organizing the collected information into key Human Resource Management (HRM) areas, “including recruitment and selection, training and development, performance appraisal, compensation and rewards, and employee engagement. Once the data was categorized, each area was examined carefully to identify recurring themes, trends, and insights related to employee productivity. This helped in understanding how different HRM practices contribute to organizational performance and workforce effectiveness.”

A comparative analysis was then conducted to evaluate the findings of different studies. By comparing the results from various sources, the researcher was able to identify common viewpoints, areas of agreement, and differences in perspectives regarding the impact of HRM practices on productivity. This process provided a broader and more balanced understanding of the topic.

Although the study primarily follows a qualitative approach and does not involve direct statistical analysis, “it also considers and incorporates the findings of quantitative studies reported in previous research. The inclusion of these empirical findings strengthens the overall analysis by providing additional evidence and supporting the conclusions drawn from the literature review.” As a result, “the study offers a more comprehensive and reliable assessment of the relationship between HRM practices and employee productivity.”

3.6 Research Approach

The study employs a deductive research methodology, using preexisting theories and conceptions about productivity and HRM as a basis for analysis. Next, secondary data is used to analyse these theoretical frameworks inside the pharmaceutical sector.

Since the deductive technique allows for the testing and validation of established theories rather than the development of new ones, it is suited for this study. Additionally, it facilitates the integration of theoretical knowledge with real-world observations, leading to a more thorough comprehension of the research subject.

3.7 Reliability and Validity of Data

Validity relates to the accuracy of the data and its relevance to the aims of the study. Reliability is the consistency and dependability of the data.

“The study strictly adheres to credible and authoritative sources such as well-respected books, peer-reviewed journals and official publications, to ensure credibility. Sources are carefully evaluated, thus, adding to their credibility.”

The validity has been ensured by choosing the data directly related to the research problem. The researcher has thoroughly analyzed sources to make sure they are highly relevant to the research. Other sources have also been cross verified to minimise bias and consistency of data.

3.8 Ethical Considerations

Academic and research ethics are strictly adhered to in this work. To prevent plagiarism, all information sources have been appropriately cited. The researcher has made sure that there has been no manipulation or misrepresentation of the data.

The study has only used reliable, publically accessible materials, and appropriate citations have been kept throughout. This guarantees openness and upholds the research's integrity.

3.9 Limitations of the Study

Despite its advantages, the study's dependence on secondary data has certain drawbacks. The study may not provide real-time insights from workers and organisations because it does not collect primary data. Furthermore, the results rely on the precision and calibre of earlier research.

Another drawback is that the researcher has no control over the original study's methodology, which could have an impact on the data's consistency. However, by utilising numerous trustworthy sources and carrying out in-depth investigation, these restrictions have been reduced.

3.10 Summary of Methodology

The conclusion of this work is that the method adopted is qualitative, descriptive and analytical research method which is based on secondary data sources. The research design, data collection and analysis methods have been carefully designed to ensure the reliability, validity and relevance of the research. Qualitative content analysis and a deductive method provide a basis for developing a comprehensive understanding of the relationship between HRM practices and productivity in the pharmaceutical industry. Although there are some obvious limitations, the methodology provides a good foundation for drawing important conclusions and furthering the scholarly understanding.

4. Findings and Discussion

Secondary data research reveals that HRM practices have direct and significant influence on the productivity of the pharmaceutical industry. The secondary data research shows that the HRM practices have a direct and reasonable impact on the pharmaceutical industry productivity. It is revealed that recruitment and selection are identified as the important factor of organisational performance. This is because employers who conduct their hiring process in a competency-based and organized manner will be

able to come up with the right talent that can truly make a difference when it comes to productivity. In poor recruiting, and inadequate hiring, on the other hand, the result is inefficiency and rising operating costs.

There are a number of factors that affect productivity. “Training and Development is one of the most important aspects, Continuous training programs enhance skills and adjust to changes in regulations and technology.” In the pharmaceutical industry, accuracy and creativity are essential, and trained staff members enhance performance and minimize errors.

Performance appraisal plays a main role in influencing employee motivation and overall productivity. When employees perceive the appraisal process as fair, transparent, and objective, they are more likely to remain motivated and committed to achieving both individual and organizational goals. An effective performance evaluation system provides employees with constructive feedback, recognizes their contributions, and helps them understand areas where improvement is needed. In contrast, appraisal systems that are inconsistent, biased, or lack transparency can lead to dissatisfaction, reduced morale, and lower levels of productivity.

Similarly, compensation and reward systems are important factors that affect employee motivation, job satisfaction, and retention. “Organizations that offer competitive salaries, attractive benefits, and performance-based incentives are generally more successful in attracting and retaining talented employees. However, financial rewards alone are often not enough to maintain long-term employee commitment. Non-monetary factors such as recognition, opportunities for career growth, professional development, and promotion also play a significant role in enhancing employee satisfaction and encouraging higher levels of performance.” Together, effective appraisal and reward systems contribute to a more motivated workforce and improved organizational productivity.

Employee participation is one of the main drivers of productivity. “Engaged employees are more committed, more creative and more productive at work. But factors such as stress, a lack of recognition, and work tension can impact our engagement adversely.” When companies care about their workers and create a positive work environment, they are more likely to see increased productivity.

Organizational culture and leadership are critical factors that influence employee performance and productivity. “A positive workplace culture encourages trust, collaboration, open communication, and employee engagement, creating an environment where individuals can perform at their best. At the same time, effective leadership plays an essential role in motivating employees, fostering teamwork, and driving innovation. Leaders who inspire and support their employees often contribute to higher levels of commitment and productivity.” In the pharmaceutical industry, transformational leadership is particularly valuable, as it encourages employees to embrace change, develop new skills, and work toward achieving organizational objectives.

By simplifying procedures like hiring, performance reviews, employee training, and workforce management, technological developments have greatly increased the effectiveness of Human Resource Management (HRM) operations. “Organisations may manage human resources more efficiently and make well-informed decisions by implementing digital tools and HR technologies. However, there are sometimes difficulties with implementing new technologies. Because they lack the requisite technical skills or are worried about their job security, many employees may oppose technological development.” By offering sufficient training, assistance, and communication to help staff adjust to new systems and procedures, HRM plays a critical role in promoting change in this setting.

The research also identifies a number of issues that, if left unchecked, can have a detrimental impact on worker productivity. “These include the necessity to adhere to stringent regulatory requirements, especially in highly regulated businesses like pharmaceuticals, as well as skill shortages and high personnel turnover.

While frequent employee turnover can raise recruitment and training expenses and impair organisational effectiveness, skill shortages can lower operational efficiency. In a similar vein, employee awareness and ongoing monitoring are necessary for regulatory compliance.” In order to overcome these obstacles and preserve a competitive and productive staff, organisations must implement proactive HRM practices. Strategic HRM approaches are required to remove these obstacles for higher-performing businesses.

5. Conclusion

The study concludes that in order to enhance productivity, the pharmaceutical sector needs efficient human resource management. “Employee performance and overall organisational success are significantly influenced by effective Human Resource Management (HRM) practices. Improving workforce efficiency and accomplishing organisational objectives are greatly aided by key HRM operations such hiring and selection, training and development, performance evaluation, pay, and employee engagement.” Effective implementation of these strategies helps firms improve operational effectiveness, foster innovation, and fortify their position as market leaders.

Despite these advantages, businesses nevertheless encounter a number of difficulties that may reduce the success of HRM programs. “If they are not effectively managed, problems including high personnel turnover, a lack of skilled workers, and resistance to organisational change can have a detrimental impact on performance and productivity. As a result, companies need to take proactive measures to deal with these issues by implementing supportive workplace policies, efficient communication, and ongoing staff development.”

In summary, HRM should be seen as a strategic partner in the success of the company rather than just an administrative task. "Pharmaceutical companies can create a highly motivated and productive workforce by aligning HRM practices with business objectives and placing greater emphasis on employee engagement, learning, and professional development." In addition to enhancing organisational performance, this strategy promotes long-term sustainability and expansion in a market that is becoming more and more competitive.
