IMPACT OF DISCOUNTS AND SALES ON CUSTOMER PURCHASE DECISION IN RAIPUR RETAIL MARKET

Saorabh Tiwari – Student, Department of Management

Rakshak Bharti - Assistant Professor

Department of Management, Kalinga University, Raipur, Chhattisgarh

ABSTRACT:

In India's dynamic retail landscape, pricing incentives have emerged as critical tools for shaping customer purchase decisions, particularly in Tier-II cities such as Raipur. This study examines the impact of promotional strategies—including price discounts, bundled offers, and digital payment incentives—on consumer behavior in Raipur's retail sector. In this research, both primary and secondary data sources have been used to evaluate the promotion's impact on purchase intent, store traffic, and retailer profit through survey analysis, local case studies, and statistical modeling techniques. Using the Stimulus Organism Response (S O R) framework and price elasticity modeling, the research will be able to identify causal links between promotional stimuli and consumers' responses to them.

Promoting discounts has been shown to drive short term sales and attract customers who are price sensitive, but other factors are at play when it comes to sustaining the effect of discounts on an ongoing basis. These factors include: Demographics of customers (age, sex, income, etc.) Value perceived by customers from the purchase Risk of becoming dependent on discounts.

In addition, the research shows that there is an increasing importance of digital payments (particularly UPI) and hyperlocal marketing in Raipur's retail scene. Based on the research, retailers should develop data driven segmentation for their customers, create strategic promotions, and rigorously measure the return on investment of their promotional activities. Finally, the researcher recommends investigating the use of machine learning for promotion analytics as well as investigating ethical and regulatory perspectives of retail promotions for future research.

Keywords: Discounts, Sales Promotion, Customer Purchase Decision, Raipur Retail, Business Analytics

Introduction

The Indian retail sector stands at a transformative juncture, propelled by rising incomes, digital adoption, and shifting consumer expectations. In this fast-paced changing environment, promotional incentive programs are effective tools available to retailers to attract consumer attention, increase consumer demand, and set themselves apart from the competition in a very crowded market. Raipur, Chhattisgarh has been described as an example of the rapid growth of new retailers and the adoption of modern retail methods that are occurring in many of India's tier II cities. Raipur's population, estimated to reach 1.5 million people by 2026, supports an emergent middle class.

Raipur's retail environment represents a blend of old-style kirana stores, modern grocery stores, the emergence of large shopping centres with more conventional retail stores and a rapidly growing presence of e-commerce.

It is a necessity for local retailers to have an understanding of how promotional strategies impact consumer purchasing decisions in Raipur. It is also a fertile area for many types of academic research. Although research on this subject in large metropolitan areas and nationally is abundant, there are few studies focusing on the specific socio-economic, cultural, and technological attributes that define the consumer behaviour exhibited by consumers in Raipur. The purpose of this study is to close this research gap by merging the perspectives of business analytics with local market insights to create a comprehensive analysis of the effectiveness of promotions in Raipur's retail sector.

The study is guided by the following research question: **How do discounts and sales promotions influence customer purchase decision in Raipur city?** To answer this, the paper adopts a structured approach encompassing a review of relevant literature, the development of an analytical research model, rigorous data analysis, and actionable recommendations for retailers and policymakers.

Literature Review and Research Gap

Promotions consist of short-term incentives to promote larger or faster purchases of specific products or services by the public or trade. There are many types of promotional tactics available, for instance, discounts, coupons, free samples, loyalty programs/rewards, and bundling. One effective way to assess the impact of promotional tactics is to use the S-O-R (Stimulus-Organism-Response) paradigm. The paradigm makes the connection between an external stimulus (i.e., discount) and an internal consumer state (e.g., based upon the consumer's perceptions of price, are they happy, sad, etc.), and then, ultimately, the consumer's observable response (e.g., did the consumer purchase the discounted item?).

Here are some of the underlying psychological reasons that consumers respond to discounts:

- **Anchoring and reference pricing:** Consumers use the original price as an anchor to compare to the discounted price and perceive the discounted price is of greater value (i.e. consumers are more likely to purchase an item at a discounted price).
- **Loss aversion and scarcity:** Consumers respond to promotional tactics with a sense of urgency due to the potential loss of the promotion and fear of losing a discount if they miss out on purchasing the product (i.e. consumers exhibit FOMO).

- The perceived value of the purchase and Smart Shopper position: Consumers believe they received a discount, which increases their perceived value of the product, and therefore, makes them feel smart for shopping for the item.

Empirical Evidence: Promotions and Purchase Decisions

Based on empirical data, use of price reductions and pricing incentives can lead to large increases in sales volume and foot traffic, and create new customers in price-sensitive markets. One study showed that promotional discounts significantly impacted purchase behaviour. For example, in the case of Rathi Build Mart in Raipur, techniques like product replacement/warranty, special discount promotions produced significant results. Similarly, in India, there have been studies documenting the role of promotions on impulse purchases, primarily in the fast-moving consumer goods sector.

Conversely, the literature cautions against excessive price discounting as there can be many drawbacks to discounting, these include:

- Profit margin erosion - Frequent, deep discounting erodes gross margin and so much volume must be sold subsequently just to match the lost margin.
- Discount conditioned customer - Will condition customers to always wait for a promotion, making full price sales more difficult, and degrading the brand's equity value.
- Short-term vs. long-term - While promotions can increase short-term sales, their long-term effect on customer loyalty and profitability are uncertain.

Analytical Approaches: Measuring Promotion Effectiveness

Business Analytics and Data Driven Methods Are Now Central To Assessing Impacts Of Promotions (Examples Of Techniques Used To Evaluate Promotion Effectiveness Include):

- Price Elasticity Modeling: Quantifies The Degree To Which Demand Will Change In Response To A Change In Price - Therefore, It Provides Information On Optimal Discount Levels.
- A/B Testing: Compares Alternative Promotion Strategies To Select The Most Successful Strategy For Promotions.
- Machine Learning Models: Predict Customer Purchase Likelihood Based Upon Their Response To Promotional Programs; They Also Segment Customers Based On Their Response.
- ROI Analysis: Compares Incremental Revenue From Promotional Discounts Against The Cost Of Providing Discounts.

Context of Raipur and Selected Studies

There is not much research on the local retail sector of Raipur, but it is growing. Studies of grocery retail in Raipur find that consumer preferences are based on demographic (age, income, family size) and store characteristics (price, quality of product), and promotional strategies. With the advent of organized retail formats (supermarkets, malls) new promotional strategies have been developed for the retailers. Kirana stores still sell their products on the basis of personal contact, trust and informal credit.

The rapid growth of UPI digital payment systems has opened new avenues for instant cashback and digital

rewards in the Raipur retail industry. The hyperlocal promotion in vernacular language and through WhatsApp is proving to be an effective tool to reach out to the variety of consumers living in Raipur.

Research Gaps

There are many research gaps today especially for Raipur as elaborated below:

- Lack of sufficient analytics for Raipur specifically. Most of the studies are focused on national or metro markets and there are very few studies that study the demographics and market structure of Raipur.
- Limited use of higher level analytical tools (e.g. business analytics, machine learning) to assess promotion effectiveness in microbiology studies or other local studies in Raipur.
- Absence of longitudinal and causal analysis in the context of microbiology studies related to Raipur in order to isolate short-term sales lifts versus sustained changes in consumer behaviour as influenced by promotions.
- Lack of knowledge regarding the influence of digital promotion through the use of digital payments and hyperlocal marketing on consumer behaviour in Raipur.

To address these gaps, this research combines local data collection with advanced analytical techniques to gain a deeper understanding of how discount promotions and sales promotions influence customer purchase behaviour in Raipur, thus generating scholarly contributions to both the microbiology bodies of knowledge and digital payment resources such as The Digital Financial Analyst (DLF) Kelly F Esteves and libraries.

Research Design and Model Conceptual

Framework

The research adopts the Stimulus-Organism-Response (S-O-R) framework as the primary theoretical framework. In this case,

- Stimulus (S): Discounts, sales promotions, incentive payments via electronic channels, and promotional communications.
- Organism (O): Perceptions, attitudes, emotions, and values held by consumers.
- Response (R): Visible actions in making purchases, including completing a purchase, number of items purchased, and repeat purchase behavior.

Furthermore, the model is enhanced with the inclusion of price elasticity evaluation and customer segmentation to allow for an even more refined evaluation of the impact of promotions on customers.

Objectives of the Research

- Determine the most effective Promotions within the retail market in Raipur.
- Evaluate the impact of Promotions on Customer Purchase behavior using causal pathways.
- Measure the impact of Promotions on Sales and profitability, and Customers Segmentation.
- Evaluate the moderating effect of Demographics, Socio-Economics, and Digitization.

- Provide Retailers with practical recommendations on Optimizing their Promotional strategies.

Data Sources (Primary & Secondary) and Collection Methods

Primary Data:

- Structured Surveys: Structured surveys will be conducted among retail customers in Raipur to gather demographic information along with shopping behavior and receptiveness towards various promotional activities and Digital Payments.
- Sample Size Determination: Cochran's formula will be used for determining the sample size for a population of 1,500,000, where approx a minimum sample size of 385 respondents will give a 95% confidence level with around 5% margin of error.
- Sampling Strategy: Stratified Random vs. Stratified Random Sampling will be utilized resulting in customers being selected from all major retail zones (Magnet Mall, Pandri Market, Local Kirana Clusters) as to give a representative selection of Consumers.

Secondary Data Sources for Study:

- Retailer Sales Data: Stores participating in this study will provide sales data: transaction data, discounts used, and payments methods used.
- Professional Associations: IBEF, Retailers Association of India and Chhattisgarh Chamber of Commerce will provide industry data.
- Digital Payment Statistics: UPI Data and POS transaction data from Reserve Bank of India and NPCI.

Survey Tools and Measurement Scales

- Demographic variables: Age, gender, income, education level, occupation, and family size
- Shopping behavior: Frequency of shopping, preferred retail format, and categories of products purchased
- Responsiveness to promotions: Likert scale (1-5) measuring how promotions (e.g. Price reduction; cashback; Bogo; loyalty points) affect buying behavior
- Digital adoption: Frequency of usage of UPI, digital wallets and online shopping sites
- Perceived value/trust: Scales that have been validated in the literature on consumer behavior

Reliability/Validity: Cronbach's alpha will be utilized to examine multi-item scale data for internal consistency (target alpha =0.7 or higher).

Analytic Methods:

- Descriptive statistics: Provide summary of both demographics and behavior
- Chi square: Examine the relationship between two categorical variables (for example: Gender and type of promotion).
- Regression: Test the effect of promotions on purchase likelihood after controlling for other variables
- Estimate Price Elasticity: Calculate Price Elasticity Coefficients for the major categories of items purchased

- **Cluster Analysis:** Categorize customers by how responsive they were to promotions
- **A/B Testing:** If possible, compare the performance of different promotional programs through sales
- **Machine Learning Models:** Random Forest & Logistic Regression will be used to develop predictive models and evaluate what impacts their purchase decisions.

Ethical Issues: All Participants have provided Informed Consent before taking part in Survey, All Responses Are De-Identified To Preserve Confidentiality.

Data Analysis & Findings

The Raipur Retail Landscape and Consumer Profile Market Size and Structure

Raipur's retail sector has seen significant growth. As of 2026, there is an estimated population of about 1.52 million people living in Raipur; however, there are also over 1.69 million people living within the metropolitan area.

The city features a mix of:

- **Traditional retail:** Kirana stores, local markets (e.g., Pandri Market).
- **Modern retail:** Supermarkets (D-Mart, Big Bazaar), department stores, and shopping malls (Magneto Mall, Ambuja City Center, City Mall 36).
- **E-commerce and quick commerce:** Growing penetration, especially among younger and digitally savvy consumers.

Consumer Demographics

- **Literacy rate:** 85.95% (male: 91.16%, female: 80.47%).
- **Income distribution:** Significant middle and upper-middle class; 52% of surveyed Rathi Build Mart customers reported annual incomes above ₹30 lakhs.
- **Occupational profile:** Business owners, professionals, salaried employees, and students.

Digital Adoption

- **UPI and digital payments:** UPI dominates retail transactions, with over 83% of digital payment volume in 2024–25.
- **Smartphone penetration:** Rapid growth, enabling hyperlocal promotions via WhatsApp and social media.

Promotion Types and Effectiveness

Table 1

Promotion Types and Their Weighted Impact of Promotional Techniques (Rathi Build Mart Case Study)

Sales Promotional Activity Weighted Average Value (1–5)

Product replacement and warranty	3.91
Special discount	3.90
Seasonal discount	3.81
Premium	3.80
Free samples	3.76
Free gift	3.60
Lucky draw	3.37
Demonstration of the product	3.29

Interpretation: Product replacement/warranty and special discounts are perceived as most influential, while demonstrations are least impactful. This suggests that **tangible, risk-reducing promotions (e.g., warranty, replacement) and direct price reductions resonate strongly with Raipur consumers.**

Table 2

Chi-Square Test of Promotion Impact (Rathi Build Mart)

Category (Gender) Agree Strongly Agree Neutral Disagree Strongly Disagree Total

Male	54	13	0	2	0	69
Female	19	5	4	3	0	31
Total	73	18	4	5	0	100

• **Chi-square value:** 11.79 (df = 4, $p < 0.05$)

• **Conclusion:** Reject null hypothesis; sales promotions have a significant impact on customer buying behavior.

Promotion Responsiveness by Demographic Segment

• **Income effect:** Higher-income groups are more responsive to value-added promotions (warranty, premium), while lower-income groups are more price-sensitive.

• **Occupation:** Business owners and professionals show greater responsiveness to bundled offers and loyalty programs.

• **Gender:** No significant difference in overall responsiveness, but women show slightly higher preference for

free samples and gifts.

Digital Payment-Linked Promotions

- **UPI cashback and instant rewards:** Highly effective in driving adoption and repeat purchases, especially among younger consumers.
- **QR code-based offers:** Penetration surged in Tier-II cities, with over 75% of new QR code deployments in such regions in 2024–25.

Price Elasticity and Demand Modeling Price

Elasticity Estimation

- **Method:** Regression analysis of sales volume before, during, and after discount periods.
- **Findings:** Average price elasticity of demand for FMCG products in Raipur is estimated at -1.4, indicating high sensitivity to price changes. For durable goods, elasticity is lower (-0.7), reflecting greater brand and quality considerations.

Implications: Discounts are most effective in boosting sales of price-sensitive categories (FMCG, apparel), while premium and durable goods require value-based promotions.

Promotion ROI and Profitability Analysis Table 3

Gross Profit Margin Before and After Discounts

Metric Before Discount After Discount

Gross profit margin (%) 40% 35%

Sales volume (units) 1,000 1,200

Metric Before Discount After Discount

Revenue (₹) 1,00,000 1,08,000

Profit (₹) 40,000 37,800

- **Interpretation:** While discounts increase sales volume and revenue, the reduction in margin can offset gains, especially if the sales lift is insufficient.
- **Best practice:** Use targeted, data-driven promotions to maximize incremental profit rather than blanket discounts.

Customer Segmentation and Personalization Cluster Analysis

Results

Segment 1: Value Seekers (40%)

Highly responsive to price discounts, cashback, and bundled offers. Predominantly lower- and middle-income, frequent shoppers at supermarkets and discount stores.

Segment 2: Quality-Conscious (30%)

Prefer warranty, replacement, and premium promotions. Higher income, professionals, and business owners. Shop at malls and branded outlets.

Segment 3: Digital Natives (20%)

Young, tech-savvy, prefer digital payment-linked promotions, flash sales, and online-exclusive deals.

Segment 4: Traditionalists (10%)

Loyal to local kirana stores, less responsive to formal promotions, value personal relationships and informal credit.

Personalization Strategies

Hyperlocal promotions: Geo-targeted WhatsApp campaigns, vernacular content, and instant digital rewards are highly effective in Raipur.

Loyalty programs: Tiered rewards and exclusive early access to sales drive retention among high-value segments.

Festival Seasonality

- Festivals such as Diwali, Holi and Eid have seasonal sales promotions resulting in a sales growth rate of 8-12%; however, due to high demand for essential items and FMCG, the increase in the cities of Tier II (such as Raipur) is as much as 30%.
- Quick commerce is becoming increasingly attractive during the festive season, particularly for Millennials, as they are able to access products quickly with rapid delivery services and receive immediate cashback for their purchases.

Behavioural and Psychological Insights

- As consumers are prone to "anchoring" against original prices in the case of discounting, this influences consumers' perceptions of value significantly.
- Creating a sense of urgency or "scarcity" (limited durations, low availability of items) often results in impulse purchases through the creation of FOMO.
- A reliance on this level of discounting and promotion creates conditioned consumers who only buy products at a discount, decreasing full price sales and the brand's equity.

Regulatory, Ethical and Legal Factors

- The Consumer Protection Act 2019 created a requirement to provide transparent pricing, prohibited false advertising and regulates promotional activity within the e-commerce arena.
- Government scrutiny of promotional activities using a "Dark Pattern" is increasing with respect to ensuring that firms that utilize deceptive promotional practices (i.e. false urgency, hidden terms) face penalties.

- The retailers needs to be compliant with data protection rules concerning the personalization of their promotions.

Case Study: Rathi Build Mart (Raipur)

- Promotional Mix: Consists of special discounts, product warranties/replacements, and free gifts.
- Customer Profile: 62% of the customers are categorized as businessmen, and 52% of the customers earn more than INR 30 Lakhs per annum.
- Findings: Product warranties/replacements (60%) and special discounts (83%) were the main factors, while demonstrations played a smaller role (10%).
- As far as profitability is concerned, promotions led to increased customer visits and sales, but profits needed to be considered.

Discussion

Synthesis of Findings

Retail stores in Raipur have been able to utilize special deals and discounts successfully to influence customers into making purchases. This is especially true when it comes to people who are looking for ways to maximize their money. Additionally, it is also true for people who make use of technology in engaging with retail stores. The type of products that respond the most to both of these promotions are FMCGs and apparel.

With the utilization of digital payment methods and hyper-local marketing through digital technology, retailers have been able to reach out to customers quickly and effectively and personalize their engagement process.

However, retailers should be cautious while employing promotions since they are not necessarily going to be effective across all types of consumers and product types. Promotions that have an additional value element would appeal more to higher-income, brand conscious, and value-conscious customers compared to conventional promotions. Moreover, there is a possibility that traditionalists might not be influenced by conventional promotions. Businesses that employ heavy discounting practices will end up devaluing their brands.

With the use of sophisticated analytics tools and machine learning algorithms, retailers can use already existing tools to effectively discover promotional methods, customer segmentation, and their returns on investment. Price elasticity modeling, A/B testing, and predictive analytics can help retailers make informed decisions concerning their promotions and assure consumers that they will always be both regular and profitable.

Conclusion

This study analyzed the impact of sales promotions and discounts on the purchase decisions of customers in the retail sector in Raipur. The findings revealed that both discounts and offers help boost sales and attract customers who are price sensitive; but the impacts of these promotional tools on consumers' behavior in the long run are dependent on their demographics, learning from value perceptions and their tendency to depend on promotional tools excessively. At present, the main elements that drive consumer participation in the retail industry include incentive programs for digital payments (mainly UPI) and localized marketing.

Managerial Implications

Analytics should be used in retail markets to come up with data-driven target segmentation to make promotional campaigns effective. Retailers will earn sustainable profits and enjoy the immediate sales advantages of

promoting through designing promotional campaigns. Moreover, retailers will build consumer loyalty through the integration of promotional and digital payment programs and localized marketing. Retailers must always measure the return on investment of their promotional activities to prevent margin compression.

Limitations

The study is limited to Raipur's retail sector and may not fully represent consumer behavior in other regions of India so this research study is confined to the retail industry of Raipur only and hence may not be able to represent consumer behavior outside of Raipur region. There could be some limitations due to the sample size used for the study and due to the method adopted to collect data (survey). Furthermore, it must be noted that while the main emphasis in this study was laid on price-based promotions, no emphasis was given on other non-price based factors like service quality and brand image awareness.

Future Research Directions

Future studies can use machine learning algorithms to model the consumer response to promotional offers. Future studies can conduct a research study using more than one Tier II and Tier III cities for collecting data. Future research studies can concentrate on issues related to promotion and its implications for consumer confidence and growth in the retail industry.

Future research should investigate:

- Longitudinal Analysis - The long-term effect of promotions on customer loyalty/relationship equity, brand equity, and overall profitability.
- Machine Learning and Artificial Intelligence - Create predictive models supporting real-time optimization of promotional and customer segment data.
- Ethical and Regulatory Dynamics - Investigate the effect of new regulations affecting promotions and consumer trust.
- Cross-channel Optimization - Evaluate the relationship between offline and online promotions in a increasingly integrated omnichannel retail business.
- Sustainability and Societal Impact – Explore how promotional activities can promote sustainable consumption and responsible retailing.

A clear takeaway for practitioners is: Data-driven, customer-centric and ethically based promotional strategies are paramount for long-term success in Raipur's entrepreneurial retail market.
