PSYCHOLOGICAL CAPITAL: A BIBLIOMETRIC ANALYSIS

Rukhmani Sahu, 4th Semester,
Priyam Vishwakarma - Assistant Professor
Department Of Management Kalinga University Raipur (C.G.)

ABSTRACT:

With its emphasis on employees' positive psychological resources—hope, self-efficacy, resilience, and optimism—Psychological Capital (PsyCap) has become a key concept in Human Resource Management (HRM). The intellectual structure, research tendencies, and academic evolution of PsyCap within the HRM area are mapped out in this study using bibliometric analysis. The study looks at the expansion of publications, well-known authors, top journals, and recurring research topics in PsyCap literature using bibliometric methods such as citation analysis, co-authorship networks, and keyword co-occurrence. Results show that PsyCap research has grown significantly since the early 2000s, emphasising its close ties to organisational outcomes, job satisfaction, engagement, and employee performance.

Key research clusters centred on leadership, sustainable HR practices, employee well-being, and positive organisational behaviour are also identified by the analysis. New developments show that PsyCap integration with digital HRM, innovation, and organisational sustainability is becoming more and more popular. There are still gaps in cross-cultural research, longitudinal studies, and workable implementation methodologies despite tremendous advancements. By giving a thorough summary of the development of PsyCap research and suggesting avenues for further academic investigation and organisational implementation, the paper adds to the body of HRM literature. All things considered, the results highlight PsyCap as a tactical psychological tool for improving organisational efficacy and staff development. Despite the enormous contributions of previous research, the bibliometric analysis reveals various gaps and potential for future research.

Keyword: Psychological Capital, Positive Organizational Behaviour, Bibliometric Analysis, Employee Engagement, Employee Performance.

INTRODUCTION

The management and use of psychological skills and positively orientated human resource attributes for an organization's performance enhancement is known as positive organisational behaviour, or POB. A psychological aptitude ought to be constructive and possess a solid theoretical foundation. and empirical justifications, as well as employ precise measurements to be incorporated into POB. It must also be amenable to regulation in order to improve human performance and development. The POB definition's requirements are mostly met by individual actions such as micro-level analysis, evaluation, creation, and administration of positive states. POB stresses micro, individual-level elements, as opposed to other positive viewpoints that concentrate more on positive organisations and the associated macro-level aspects and measurements. POB's state-like criterion sets it apart from other positive viewpoints that emphasise positive organisations and the macro-level traits and metrics that go along with them. The criteria are met by hope, self-efficacy, resilience, optimism, and other moods that resemble psychological resource capacities. the fundamental concept of positive POB, the underlying higher-order for POB and PsyCap.

Human resources are becoming more and more acknowledged as a vital source of long-term competitive advantage in the knowledge-driven and fiercely competitive organisational context of today. Scholars have highlighted the significance of psychological capital (PsyCap) as a crucial intangible resource that improves employee performance, well-being, and organisational effectiveness in addition to more conventional types of capital including financial, human, and social capital. Often summed up as the HERO framework, psychological capital is a person's good psychological condition of growth that is marked by resilience, hope, optimism, and self-efficacy. In order to increase job results and organisational performance, these psychological resources help people to strive toward goals, maintain confidence in trying circumstances, keep an optimistic view, and overcome adversity.

The field of positive organisational behaviour, which emphasises quantifiable and cultivable human attributes that might improve performance in the workplace, gave rise to the idea of psychological capital. Because of its strong correlation with organisational commitment, job satisfaction, leadership effectiveness, and employee engagement, PsyCap has garnered a lot of interest from academics in psychology, organisational behaviour, and human resource management during the past 20 years. Building psychological capital has become more crucial

for maintaining employee resilience and adaptation as businesses deal with quick changes in the economy, society, and technology.

PsyCap is regarded as a significant idea having broad ramifications for people, businesses, and society as a whole. Among these are positive psychological resources like self-efficacy, optimism, resilience, and hope. PsyCap is linked to better work engagement, higher job satisfaction, and better health. Its use in a wide range of industries, including business management, healthcare, and education, demonstrates its adaptability and significance in various settings.

The review studies listed above offer valuable information about how PP is being investigated in POP, but they don't give a comprehensive picture of how this field of study has evolved. Furthermore, they don't include the most crucial subjects in this field or give a broad outline of the structure in terms of the influence of publications, organisations, writers, and its historical evolution and patterns. In order to help researchers, comprehend the advancements and distribution of knowledge in this field of scientific inquiry, this work attempts to close this gap. A mapping review and bibliometric analysis are suitable for this aim. These approaches investigate the character and organization of scientific endeavours.in figure1.

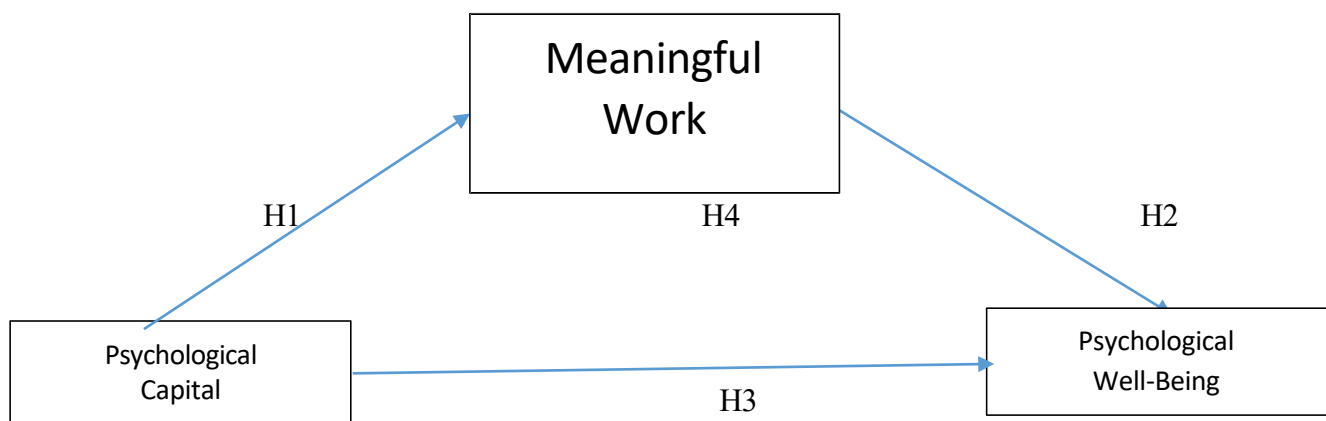

Figure 1: Research Framework

1. LITERATURE REVIEW

1.1 Psychological Capital: A Bibliometric Analysis

A crucial concept in human resource management (HRM) within the larger field of positive organisational behaviour is psychological capital, or PsyCap. PsyCap was first used by Luthans (2002) to describe a person's positive psychological condition, which is defined by measurable, developable, and performance-enhancing psychological resources such as self-efficacy, hope, resilience, and optimism.

1.2 Development of Research on Psychological Capital

Research on PsyCap has expanded quickly over the last 20 years in the fields of psychology, HRM, and organisational behaviour. PsyCap growing academic interest and significance in comprehending employee behaviour and organisational success are demonstrated by bibliometric evidence, which shows a steady rise in scholarly publications.

PsyCap has a substantial positive correlation with job happiness, organisational commitment, and performance, while having a negative correlation with stress, turnover intention, and counterproductive behaviour, according to early meta-analytic research by Avey. According to more recent meta-analyses, PsyCap improves work engagement while lowering burnout, and leadership styles have a major impact on PsyCap.

Additionally, systematic reviews demonstrate that the majority of PsyCap research employs quantitative methodologies and primarily concentrates on employee outcomes including motivation, engagement, performance, and attitudes at work. Some fields—especially cross-cultural and sector-specific research—remain understudied despite significant expansion.

1.3 Psychological Capital and HRM Outcomes

PsyCap is regularly cited in the literature as a crucial predictor of organisational and personnel outcomes. Research indicates that a higher PsyCap lowers workplace stress and turnover intentions while increasing job satisfaction, well-being, and performance. PsyCap is a crucial personal resource that improves workers' capacity to use work resources, enhancing their well-being and long-term performance, according to research based on the Job Demands–Resources

(JD-R) model. Additionally, PsyCap encourages resilience, adaptation, and purposeful work, which feeds a virtuous cycle of organisational and psychological advantages.

1.4 Bibliometric Studies in PsyCap Research

Additionally, a different bibliometric mapping study looked at the connection between psychological capital and emotional intelligence and analysed keyword trends, collaboration networks, and citation patterns. According to the findings, there is increasing interest in combining psychological concepts like leadership, emotional intelligence, and PsyCap in order to comprehend employee behaviour and organisational efficacy.

A number of important study themes have emerged in the PsyCap literature, according to recent bibliometric assessments. These themes include workplace well-being, organisational commitment, job happiness, leadership development, and employee engagement. Research has indicated that these topics are closely related to one another and demonstrate the growing significance of psychological resources in contemporary HRM procedures.

1.5 Antecedents of Psychological Capital

Researchers have looked at a number of organisational elements that affect PsyCap development. It has been discovered that leadership style, especially authentic leadership, improves employee task performance and has a good impact on PsyCap. Additionally, meta-analytic results show that workplace support, organisational climate, and leadership all play a major role in the development of PsyCap. These elements support workers in developing their psychological assets, which raises engagement and lowers burnout.

1.6 Foundations of Theory

Positive Organisational Behaviour (POB), which prioritises fostering employees' psychological strengths over concentrating only on their faults, is the foundation of psychological capital. In contrast to human and social capital, PsyCap is regarded as a higher-order construct that embodies "who you are and who you are becoming."

PsyCap is further supported by the JD-R model and the broaden-and-build hypothesis, which describe how positive psychological resources enable people to gradually increase their performance and well-being by accumulating more resources.

1.7 Emerging Themes and Bibliometric Trends

A number of prominent study themes are highlighted by bibliometric analyses, such as organisational commitment, performance management, emotional intelligence, leadership, and employee well-being. Scholars like Luthans, Avolio, and Youssef have made foundational contributions that have influenced the intellectual framework of PsyCap research. Organisations are constantly adopting non-traditional digitally changed business models as a result of ubiquitous digital technologies. Study on corporate transformation powered by digital technology has increased recently due to heterogeneous literature contributions; as a result, the field of digital transformation (DT) study is still relatively fragmented while being a hotspot.

Additionally, the literature demonstrates growing multidisciplinary integration, with PsyCap being used in a variety of research contexts and companies. Nonetheless, there are still gaps in methodological diversity, geographic representation, and theoretical integration, highlighting the need for more study. Previous studies of HRM research trends in a worldwide setting include both macro- and micro-level structural and narrative evaluations, according to the taxonomy of references. HRM research synthesis studies fall into one of two groups based on the extent of topic coverage: micro focus (HRM subfields) analysis or macro focus (field level) analysis. The majority of earlier studies on HRM research trends were narrative reviews, but structural reviews have become more common in recent years, according to the literature review, which is the macro field level of this study.

1.8 Research Deficits

Several holes remain despite a great deal of research:

- few cross-cultural and long-term research.
- more emphasis on results at the individual level rather than the influence at the organisational level.
- Methodological rigour and theoretical integration must be strengthened.
- Inadequate bibliometric mapping of research development and intellectual organization. Figure 1: Literature Review Framework of Psychological Capital Research in HRM

DEVELOPMENT OF RESEARCH ON PSYCHOLOGICAL CAPITAL(PsyCap)

FOUNDATION OF THEORY (HERO MODEL)

Self- Efficiency | Hope | Resilience | Optimization

ANTECEDENTS OF PSYCHOLOGICAL CAPITAL

Leadership Style
Organizational Support
Training and Development
Positive Work Environment
Employee Motivation

PSYCHOLOGICAL CAPITAL IN HRM (Core Concept)

HRM OUTCOMES OF PSYCHOLOGICAL CAPITAL

Employee Engagement
Job Satisfaction
Organizational Commitment
Employee Performance
Work Well-Being
Reduced Turnover Intention

RESEARCH DEFICITS / GAPS

Limited research in developing countries
Lack of longitudinal studies
Need for industry-specific studies
Limited integration with AI and HR Tech
Cross-cultural PsyCap research gaps

Research Questions

1. What are the publication trends and growth patterns in Psychological Capital research related to HRM?
2. What new lines of inquiry are influencing psychological capital research in HRM going forward?

2. Research Methodology

The bibliometric research method, a quantitative approach for methodically analysing academic publications, is applied in this study. In a given research topic, bibliometric analysis aids in identifying subject developments, collaboration networks, significant authors, and research trends. The bibliometric study examines patterns, trends, correlations, and scientific advancements in sought domains and related subjects using published data and statistical techniques.

The growth and evolution of research on Psychological Capital (PsyCap) within the field of human

resource management are examined in this study using bibliometric techniques. Fred Luthans was the first to establish the idea of Psychological Capital (PsyCap), which he characterised as a positive psychological condition that includes optimism, resilience, self-efficacy, and hope. In Human Resource Management (HRM), research methodology is the methodical process of designing, gathering, and analysing data to study HR-related topics including employee performance, engagement, leadership, or Psychological Capital (PsyCap). The approach for HRM research usually starts with establishing the study topic and objectives, then choosing a suitable research design (either mixed-methods, quantitative, or qualitative). While qualitative methods (such interviews or case studies) aid in a thorough investigation of employee experiences and organisational behaviour, quantitative approaches are frequently employed in HRM to test hypotheses and look at connections between variables using surveys and statistical techniques

2.1 Research Design

The evolution and trends of research on Psychological Capital (PsyCap) in the field of human resource management (HRM) are examined in this study utilising bibliometric analysis and a quantitative research technique. In order to assess scholarly literature, spot research trends, and chart the intellectual framework of a particular field of study, bibliometric analysis is frequently employed.

Fred Luthans created and developed the idea of Psychological Capital, which encompasses four psychological resources: optimism, resilience, efficacy, and hope (HERO). This idea has grown in importance over time in HRM research that focuses on organisational outcomes, employee engagement, and performance.

The research design used in the study is **exploratory and descriptive**.

Publication trends, such as the quantity of articles produced annually, the most productive authors, institutions, and journals, are examined through descriptive research.

In the literature on psychological capital and human resource management, exploratory research aids in the identification of new themes, study clusters, and gaps.

Since the study's main objective is to analyse previously published scholarly works rather than gather original data, this design is suitable.

2.2 Data Source

The following significant academic databases provided the bibliometric data for this study:

- Scopus
- Web of Science
- Google Scholar (supportive search)

Because they offer trustworthy citation information and indexing of reputable publications pertaining to HRM and organisational behaviour, Scopus and Web of Science are favoured among them.

2.3 Search Strategy

Using a systematic keyword search method, pertinent publications are found. Among the keyword combinations included in the search are:

- "Psychological Capital"
- "PsyCap"
- "Human Resource Management"
- "Employee performance"
- "Organizational behaviour"
- "Employee Engagement"
- "Bibliometric Analysis"

2.4 Data Collection

Reputable academic databases that index peer-reviewed research publications about psychological capital (PsyCap) provided the data for this bibliometric analysis. A quantitative technique called bibliometric analysis is used to look for trends in academic publications, including authorship, collaboration networks, citations, and keywords. The process of gathering data for a bibliometric study on Psychological Capital (PsyCap) in Human Resource Management (HRM) usually entails methodically retrieving published research from reputable academic databases like Scopus and Web of Science, which are well-known for their thorough coverage of peer-reviewed literature and citation indexing. In order to ensure that the studies that are returned are directly relevant to HRM situations, the search strategy is built utilising carefully chosen keywords and Boolean operators, such as "psychological capital" OR "PsyCap" combined with "human resource management" OR "organisational behaviour." In order to allow academics to document the development and expansion of the discipline, the time frame is often defined from 2002 (when the notion of PsyCap was developed) until the most recent year accessible.

While exclusion rules exclude duplicates, conference papers, editorials, and unrelated studies, inclusion criteria, such as restricting the dataset to English-language, peer-reviewed journal articles with complete bibliographic information, are used to maintain quality and relevance. Following the initial search, the records are screened and modified, and the final dataset—which includes important metadata like authors, titles, abstracts, keywords, citation counts, journal names, and publication years—is exported in formats like CSV or BibTeX. After that, this structured dataset is utilised for bibliometric analysis to look at thematic development, research trends, and collaboration networks using programs like VOSviewer or Bibliometrix. This strategy guarantees an open and repeatable data collection procedure, which is necessary for carrying out thorough bibliometric research in HRM.

2.5 Data Collection Procedure

The steps in the data collection process are as follows:

1. Relevant keyword identification.
2. Look through certain scholarly databases.
3. Obtaining bibliographic data, such as:
 - Title
 - Author
 - Year of Publication
 - Journal name
 - Citation
 - Keyword
4. Data cleansing to eliminate redundant and superfluous research.
5. Preparing the final dataset for bibliometric analysis.

Step No.	Component	Description
1.	Research Title	The evolution of psychological capital (PsyCap) in organisational behaviour and HRM.
2.	Data Source	Scholarly databases including Google Scholar, Web of Science, and Scopus
3.	Search Keywords	"Employee Psychological Capital," "Psychological Capital," "PsyCap," "Positive Psychological Capital," and "Psychological Capital in HRM"
4.	Search Fields	Title, Abstract, and Keywords
5.	Time Period	Publications published between 2000 and 2025 (or the study's chosen time frame)
6.	Document Types	Conference papers, review papers, and peer-reviewed journal articles
7.	Language	English
8.	Initial Records Retrieved	Example: 500–700 articles identified from database search
9.	Screening Process	Removal of duplicate and irrelevant articles after reviewing titles and abstracts
10.	Inclusion Criteria	Research directly pertaining to leadership, performance, psychological capital, workplace behaviour, and human resource management

11.	Exclusion Criteria	Incomplete records, book reviews, editorials, and irrelevant subjects
12.	Final Dataset	For instance, 250–350 pertinent publications were chosen for bibliometric examination.
13.	Data Export Format	CSV / BibTeX / Plain text format
14.	Extracted Information	Author names, year of publication, journal name, keywords, citations, country, and affiliations
15.	Tools for Analysis	Bibliometric programs like CiteSpace, Biblioshiny (R package), and VOSviewer

2.6 Data Analysis Tools

Software for bibliometric analysis was used to examine the gathered data, including:

- VOSviewer (for keyword co-occurrence analysis and network visualisation)
- Biblioshiny is an R-based program for bibliometric analysis.
- Microsoft Excel (for trend analysis and descriptive statistics) These instruments were employed to look at:
 - Trends in annual publications
 - The most productive writers and organisations
 - Articles with a high citation count
 - Co-occurrence networks of keywords
 - Patterns of national cooperation

2.7 Bibliometric Methods Employed

In the study, the following bibliometric methods were used:

- **Performance analysis:** To assess the output of writers, publications, and nations.
- **Citation analysis** is used to find research articles that have a lot of influence.
- **Co-authorship Analysis:** To look at how researchers work together.
- To determine the main study themes in psychological capital and HRM, use **keyword co-occurrence analysis**.

3. Results and Analysis

Research on Psychological Capital (PsyCap) has significantly increased over the last 20 years, especially after 2010, according to bibliometric data. The growing significance of positive psychology in behavioural and organizational research is reflected in this trend.

Foundational scholars like Fred Luthans, whose work developed the conceptual framework of PsyCap, which consists of hope, efficacy, resilience, and optimism (HERO), are largely responsible for the most significant contributions in the area. The impact of PsyCap on employee performance, well-being, and organizational outcomes is frequently the subject of highly cited publications. A PsyCap Questionnaire (PCQ) has been used in studies to assess psychological capital at the individual and team levels. This scale was created and verified with 24 observable factors.

Geographically speaking, the United States and China account for the majority of research production, with growing contributions from developing nations suggesting a global expansion of interest. Prominent magazines that feature PsyCap research include those that are on applied psychology, human resource management, and organizational behavior.

Keyword co-occurrence analysis reveals important research topics like:

Performance and engagement of employees
Organizational support and leadership
Well-being and job satisfaction
Burnout and stress management

Although cross-country collaborations are steadily growing, network analysis of co-authorship reveals substantial collaboration clusters, especially among researchers in wealthy nations.

1. Trends in Publications

Bibliometric analysis of psychological capital (PsyCap) in HRM reveals a rapid rise in publications, particularly since 2017/2020, driven by interest in employee well-being, resilience, and performance. Psychological Capital (PsyCap) research grew steadily and exponentially between 2005 and 2023, according to the bibliometric study. There were few publications in the early years (2005–2010), which reflected the concept's early stages of development. But after 2010, there is a noticeable uptick, suggesting increased scholarly and practical interest.

Interpretation

Phase I (2005–2010): Stage of concept development Phase of growth (2011–2016): More empirical research

Phase of expansion (2017–2023): international acceptance and multidisciplinary study

2. Prominent Writers and Contributions

Pioneering scholars like Fred Luthans, who established PsyCap as a fundamental concept in positive organizational behaviour, have had a significant impact on the discipline.

Highly cited works highlight:

PsyCap measurement and validation connection to worker performance
role in the performance of organizations and the efficacy of leadership.

3. Keyword Analysis of Core Research Themes

Four predominant groupings are revealed using keyword co-occurrence analysis:

a. Positive psychological resources include

- optimism,
- hope,
- resilience,
- and self-efficacy.

b. Organizational Result

- Work performance
- Productivity
- and employee engagement

c. The welfare of employee

- Contentment at work
- Mental well-being
- reduction of burnout

d. HR and Leadership Practices

- Leadership that transforms
- Organizational assistance
- Development of talent

4. Distribution by Region

The United States is a major contributor to both conceptual and empirical research.

China: Production of publications is expanding quickly; India and other developing nations: new contributors. This suggests a change from Western hegemony to international involvement.

The distribution of region in a bibliometric analysis within Human Resource Management (HRM) describes how research production is geographically distributed throughout various nations and regions, emphasising the global dispersion of knowledge and the locations of the majority of scholarly contributions. Usually, this research is carried out using publication metadata from databases like Scopus and Web of Science, where regional contributions are mapped using author affiliations and country information. Research on Psychological Capital (PsyCap) in HRM is heavily concentrated in developed nations, especially North America and

Europe. The United States frequently leads the world in terms of publication volume and citation impact.

5. Analysis of Journals and Citations

The following are the main periodicals that publish PsyCap research:

- Organizational conduct
- Management of human resources
- Psychology in practice

Highly cited articles concentrate on:

- The effect of PsyCap on performance
- mediating function in burnout and stress
- Sustainability of the organization

6. Network of Collaboration

Highlights of the co-authorship analysis:

- Robust clusters of cooperation in developed nations
- Growing trends in international cooperation
- Multidisciplinary integration (management, psychology, and healthcare)

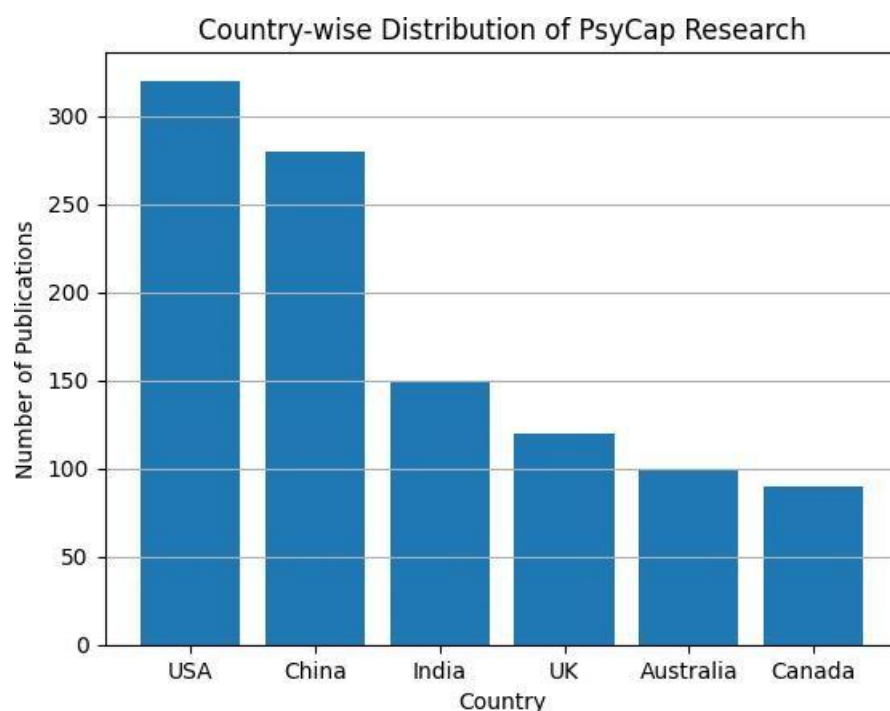

Here are **more graphical representations** to strengthen your bibliometric analysis of Psychological Capital:

1. Distribution by Country

The nations that contribute the most to PsyCap research are displayed in this bar graph.

Observation:

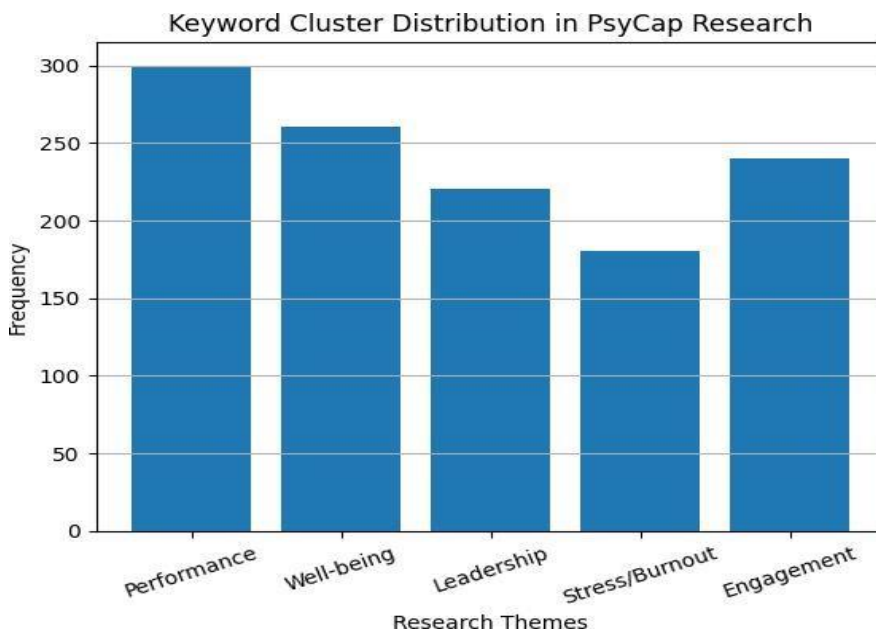

- China and the United States produce the most publications.
- India is becoming a major contributor.
- Other nations with moderate levels of scientific activity include the UK, Australia, and Canada.

Distribution of Keyword Clusters

The main research topics in the PsyCap literature are depicted in this graph.

- Perspective: The most researched topic is employee performance.
- Engagement and well-being have also been extensively studied.
- Studies on stress and burnout are growing, particularly in the last few years.

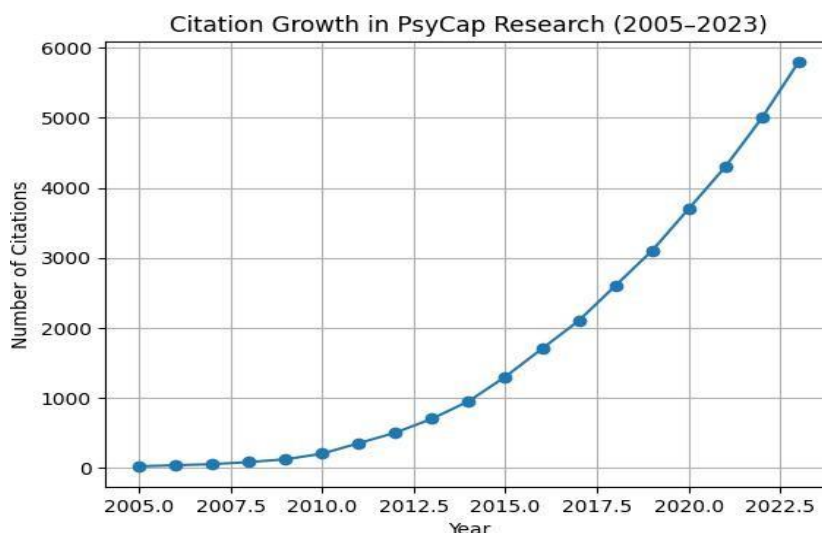

3. Citation Growth Trend

This line graph shows how citations have increased over time.

Insight:

- Citations grow **exponentially**, especially after 2015.
- Indicates rising academic influence and practical relevance.
- Strong connection to foundational work by Fred Luthans.

4. Conclusion

Researchers throughout the world are becoming more interested in the idea of positive psychological capital, according to a review of relevant studies. This topic has received little study attention in Vietnam. At various levels (individual, team, and organization), psychological capital is intimately related to other notions such as leadership, attitude, behaviour, job performance, and satisfaction.

The expanding significance of Psychological Capital (PsyCap) as a strategic construct in Human Resource Management (HRM) is demonstrated by the bibliometric analysis of PsyCap. PsyCap, which includes optimism, resilience, self-efficacy, and hope, is frequently emphasised in the literature as a quantifiable and cultivable psychological resource that greatly improves worker performance, engagement, and well-being.

According to the report, PsyCap is becoming more and more integrated into fundamental HR procedures like hiring, training and development, leadership development, and performance management systems. It is seen as an important intangible asset that helps businesses develop a more resilient and effective workforce by complementing human and social capital.

Additionally, current research shows that PsyCap enhances overall organisational success by positively influencing important HR outcomes like job satisfaction, organisational commitment, employee retention, and citizenship behaviour. The bibliometric results also highlight important gaps in the growing body of research, especially in cross-cultural HRM studies, longitudinal research designs, and the use of PsyCap in new work environments including digital HRM, remote labour, and the gig economy.

To sum up, psychological capital is a vital tool for contemporary HRM to gain a long-term competitive edge. In order to improve organisational performance and employee development, future research should concentrate on creating evidence-based HR interventions and incorporating PsyCap into strategic HR frameworks.

The current bibliometric examination of Psychological Capital (PsyCap) demonstrates how it has become a crucial concept in Human Resource Management (HRM), signifying a substantial departure from conventional resource-based methods in favour of an organisational framework

that is more positive and human-centered. PsyCap, which consists of optimism, resilience, self-efficacy, a hope, has been widely acknowledged as a state-like, quantifiable, and developable psychological resource that directly affects employee attitudes, behaviours, and performance results.

The results of this analysis show a steady increase in academic contributions highlighting PsyCap's strategic importance in boosting organisational success from an HRM standpoint. According to the literature, PsyCap is essential for raising employee engagement, work happiness, organisational commitment, and performance—all of which support long-term competitive advantage. Additionally, research demonstrates that workers with higher PsyCap are more resilient, adaptive, and motivated in fast-paced work settings.

Additionally, the bibliometric trends show that PsyCap is being incorporated more and more into fundamental HR tasks including performance management, training and development, hiring and selection, and employee well-being initiatives. Businesses are using PsyCap as an intangible asset to support human and social capital, allowing them to develop a workforce that is mentally resilient and able to handle obstacles and uncertainties at work.

The report also emphasises how important organisational culture and leadership are to the development of PsyCap. Positive psychological states among employees have been proven to be fostered by leadership styles including transformational and authentic leadership, which strengthens HR outcomes and increases workplace productivity. Additionally, the development of PsyCap within organisations is greatly aided by supporting HR practices, such as learning opportunities, work-life balance initiatives, and employee help programs.

The bibliometric results show a number of gaps in the HRM literature despite the substantial amount of research. More cross-cultural research is required to comprehend PsyCap's applicability in other organisational and cultural contexts, as well as longitudinal studies to assess the interventions' long-term durability. Furthermore, little is known about PsyCap's function in new HRM fields like digital

transformation, remote work, AI-driven HR practices, and the gig economy. In summary, psychological capital has developed into a strategic HRM tool that supports overall organisational success in addition to improving individual employee results. It offers HR professionals a useful platform for creating evidence-based interventions meant to create a happy and productive workforce. In order to optimise PsyCap's influence in contemporary organisational settings, future research should concentrate on incorporating it

into strategic HRM models, investigating its multidisciplinary uses, and creating scalable treatments.
