**Faculty of Commerce & Management, Kalinga University, Raipur, Chhattisgarh**

**ABSTRACT:**

*The rapid adoption of work-from-home (WFH) models has transformed traditional workplace structures, prompting critical examination of their impact on employee performance. This study explores the relationship between WFH arrangements and key performance outcomes, particularly focusing on productivity and work-life balance. Drawing on a combination of qualitative insights and quantitative analysis, the research investigates how flexible work environments influence employee efficiency, motivation, and overall well-being. The findings suggest that WFH models can significantly enhance productivity when supported by clear communication, appropriate digital infrastructure, and well-defined performance expectations. Employees often benefit from reduced commuting time and increased autonomy, which can lead to higher task completion rates and improved focus. However, the study also identifies challenges such as blurred work-life boundaries, social isolation, and the risk of overworking, which may negatively affect long-term performance and mental health. Furthermore, the research highlights the critical role of organizational support systems, including managerial trust, flexible scheduling, and employee engagement strategies, in optimizing the effectiveness of remote work. Work-life balance emerges as a key determinant of sustainable productivity, with employees reporting greater satisfaction when they can effectively manage personal and professional responsibilities. Overall, this study provides a nuanced understanding of WFH models, emphasizing that while they offer substantial benefits, their success depends on thoughtful implementation and continuous adaptation. The insights contribute to the growing body of knowledge on modern work practices and offer practical implications for organizations seeking to design resilient, employee-centric work environments in an evolving professional landscape.*

**Keywords:** *Work-from-Home (WFH), Remote Work, Employee Performance, Productivity, Work-Life Balance, Flexible Work Arrangements, Work Autonomy*

## 1. Introduction

The landscape of modern employment has shifted significantly, moving away from traditional office structures toward Work-from-Home (WFH) models. Driven by digital innovation and global connectivity, this transition has challenged the assumption that physical presence is a prerequisite for professional efficiency. Consequently, organizations are increasingly prioritizing outcome-based results over time-bound attendance, prompting a deeper

investigation into how remote work affects both output and employee well-being.

The primary advantage cited for remote work is its capacity to boost productivity. By removing the burden of commuting and minimizing office-based interruptions, employees can often achieve a higher state of focus. Furthermore, the flexibility to align professional tasks with personal peak performance hours can enhance overall efficiency. However, these benefits are not universal; they are often mediated by individual work habits, the nature of the specific job role, and the prevailing organizational culture.

Equally critical is the impact of WFH on work-life balance. While the integration of domestic and professional spheres offers greater flexibility for personal responsibilities, it also risks blurring boundaries, leading to extended hours and potential burnout. This dual nature of remote work suggests that success is largely dependent on organizational support. Companies that cultivate a culture of trust, provide robust technological infrastructure, and maintain clear communication are far more likely to see positive results than those with rigid or unsupportive frameworks.

Ultimately, understanding the true effectiveness of WFH requires a holistic view that considers productivity and well-being as interconnected rather than isolated metrics. This research aims to bridge existing gaps in literature by examining these outcomes simultaneously. As hybrid models become a permanent fixture of the global economy, providing evidence-based insights is essential for organizations seeking to build sustainable work environments that drive performance without compromising the health of their workforce.

## 2. Literature Review with identified research gap

The rise of Work-from-Home (WFH) models has shifted the academic focus toward how remote environments impact productivity and work-life balance. Initially viewed as a tool for cost-cutting and flexibility, remote work is now recognized for its complex psychological and structural effects. While many researchers argue that WFH boosts efficiency by eliminating commutes and minimizing

office disruptions, others point out that these gains depend heavily on an individual's digital literacy and home environment.

Regarding work-life balance, the literature presents a dual reality. On one hand, WFH allows for better integration of personal and professional duties; on the other, it often results in "work-life spillover," where blurred boundaries lead to extended hours and potential burnout. Scholars agree that the success of these arrangements hinges on organizational support—specifically managerial trust, clear communication, and robust technical infrastructure. Without these, employees often face isolation and a decline in team cohesion.

Current research, however, frequently treats productivity and well-being as isolated factors, often focusing on short-term data from specific industries. There is a notable lack of integrated, long-term studies that examine how these two elements interact to shape overall performance across diverse cultures. This study addresses these gaps by analyzing WFH through a holistic lens, aiming to identify strategies that optimize both operational efficiency and enduring employee health.

**3. Research Design**

This study utilizes a descriptive and explanatory research design to evaluate how Work-from-Home (WFH) models influence employee productivity and work-life balance. By combining these approaches, the research aims to document current remote work trends while identifying the underlying causal links between flexible arrangements and employee well-being.

Adopting a quantitative methodology, the study relies on primary data gathered through a structured questionnaire. This instrument employs Likert-scale questions to quantify variables

such as job satisfaction, organizational support, and perceived efficiency. A cross-sectional approach is used to capture a snapshot of these dynamics across a diverse demographic of professionals from various industries, utilizing convenience sampling for practical data collection.

The conceptual framework identifies WFH practices as the independent variable and employee performance—measured through productivity and work-life balance—as the dependent variable. Crucially, organizational support (encompassing technology and management styles) is treated as a moderating variable that can either amplify or diminish the success of remote work outcomes.

Data analysis will involve correlation and regression techniques to test hypotheses and determine the strength of relationships between variables. Reliability is maintained through Cronbach’s alpha tests.

Ultimately, this framework offers a systematic way to understand how structured support can optimize the WFH experience for both the individual and the organization.

### 3.2 Research Objectives

- To examine the demographic composition of respondents and its influence on remote work experiences
- This objective focuses on understanding how characteristics such as gender and industry background shape employees' perceptions, adaptability, and performance in Work-from-Home (WFH) settings.
- To analyze employee preferences towards different work modes and their implications for organizational policies
- This aims to evaluate whether employees prefer fully remote, hybrid, or office-based work models, and how these preferences impact engagement, satisfaction, and productivity.
- To evaluate the sustainability and long-term feasibility of remote work practices across different sectors

**Fig 1: Work Frome Home Model**

## 4. Data Analysis and Findings

Data for this study was gathered from 50 participants using a digital questionnaire, providing a focused dataset for preliminary analysis. Utilizing an online platform ensured a streamlined and efficient collection process, while the requirement of unique identifiers helped maintain data integrity by preventing duplicate submissions. The respondent pool reflects a variety of perspectives on remote work, offering a broad view of how different individuals experience the shift toward work-from-home models.

While convenience sampling allowed for practical data acquisition, the sample size of 30 serves as a foundational insight rather than a universal representation of the entire workforce. These primary insights are instrumental in identifying emerging trends regarding employee efficiency and professional output. Although the digital nature of the survey and the limited participant count suggest a need for careful interpretation, the resulting data provides a reliable basis for exploring the relationship between remote work environments and overall organizational performance.

**Fig 2: The Age distribution of respondents**

The age distribution of respondents shows a strong concentration in the younger working population. The majority of participants fall within the 21–25 age group, accounting for 70% of the total responses, indicating that the study is largely influenced by early-career individuals. This suggests that the findings may primarily reflect the experiences, adaptability, and perceptions of younger employees toward work-from-home models.

A smaller proportion of respondents belong to the 26–40 age group (16.7%), followed by 31–40 (13.3%). These groups provide some level of variation in experience and professional maturity, but their representation is comparatively limited. Notably, there are negligible or no responses from individuals below 20 or above 40, indicating a lack of input from very young or highly experienced professionals.

Overall, the data is skewed toward a younger demographic, which may influence the overall results, particularly in areas such as technological adaptability, work-life balance preferences, and productivity in remote work settings. Therefore, while the responses are useful, the conclusions drawn should be considered more representative of younger employees rather than the entire workforce.

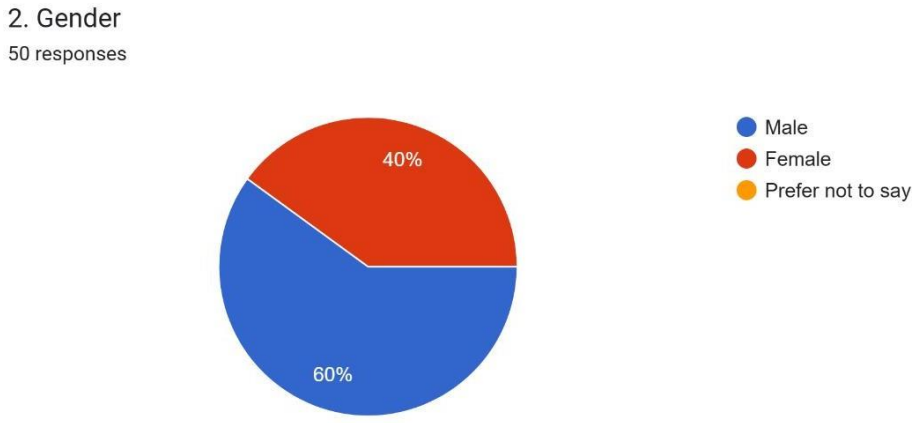

Fig 3: The gender distribution of respondents

The gender distribution of respondents shows a relatively balanced participation, with a slight dominance of male respondents. Out of the total 50 responses, 60% are male and 40% are female, while no respondents selected the “prefer not to say” option. This indicates that both genders are fairly represented, allowing for a more inclusive perspective in the analysis.

The higher proportion of male respondents may slightly influence the overall findings, especially if perceptions of work-from-home differ across genders. However, the presence of a substantial percentage of female participants ensures that diverse viewpoints are still captured. This balance improves the credibility of the study, as it does not rely heavily on a single gender group.

Overall, the gender composition supports a reasonably unbiased analysis, though the slight male majority should be considered when interpreting the results related to employee performance and work-from-home experiences.

**Fig 4: Analysis of Employment Demographics**

The survey data reveals a diverse distribution of employment statuses among the participants, indicating that the research findings represent a wide spectrum of professional experiences.

Distribution Breakdown

- Dominant Group: The largest segment of respondents consists of Interns, making up 33.3% of the total. This suggests a significant representation of individuals in early-career stages or temporary learning roles.
- Mid-Tier Representation: Both Full-time employees and Self-employed individuals are equally represented, each accounting for 26.7% of the sample. This balance allows for a comparative analysis between traditional corporate structures and independent work models.
- Minority Group: Part-time workers constitute the smallest portion of the demographic at 13.3%.

**Fig 5: Analysis of Work Mode Preferences**

The data indicates a strong inclination toward flexible working arrangements within the surveyed group, with a significant majority operating outside of a traditional, full-time office environment.

Data Trends and Statistics

- Primary Work Mode: Fully Remote (WFH) emerged as the most prevalent work arrangement, adopted by 43.3% of the respondents. This suggests that nearly half of the sample has transitioned to a digital-first professional life.
- Hybrid Adoption: Exactly one-third of the participants (33.3%) utilize a Hybrid model, balancing their time between the office and a home environment.

- Traditional Office Presence: The Fully Office-based model is the least common among the group, representing only 23.3% of the total responses.

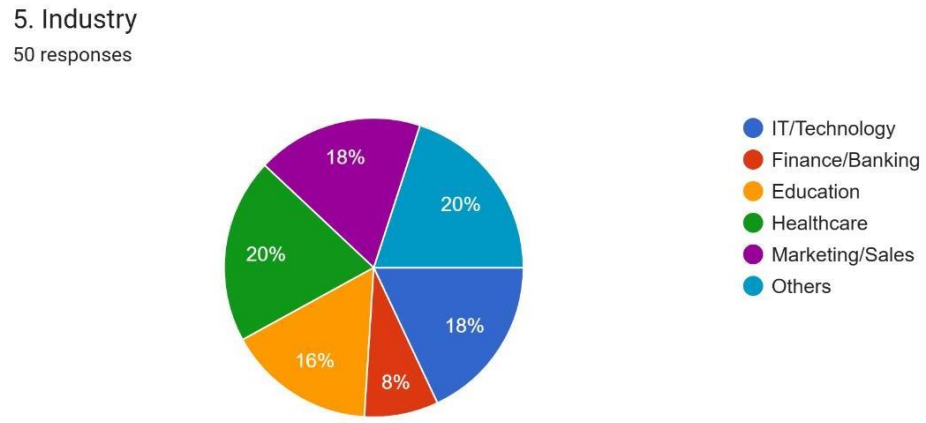

**Fig 6: Industry-Wise Respondent Distribution**

The survey captures perspectives from a variety of sectors, ensuring that the research findings are not limited to a single industry but reflect broader market trends.

Sectoral Breakdown

- Primary Representation: The Marketing/Sales sector is the most prominently represented, accounting for 50% of the participants. This is closely followed by IT/Technology, which constitutes 23.3% of the sample.
- Secondary Sectors: A significant portion of respondents (20%) belongs to the "Others" category, indicating a long-tail distribution of various niche industries.
- Institutional Representation: The remaining participants are distributed across healthcare (13.3%) and Education (10%).
- Minimal Representation: The Finance/Banking sector represents the smallest specialized group in this specific data set (approximately 3.4%, based on the remaining slice).

Fig 7: Evaluation of Remote Work Longevity

This section analyses the tenure of participants in work-from-home (WFH) environments, providing context for the depth of their experience with remote professional models.

Experience Tenure Breakdown

- Predominant Group (Recent Transitioners): A significant majority, 63.3%, have been

working from home for less than 6 months. This indicates that the largest portion of the sample is currently navigating the initial stages of remote adaptation or has recently transitioned into this model.

- Established Remote Workers: Those with 1–2 years of experience and those with more than 2 years of experience represent equal segments of the sample at 13.3% each.
- Intermediate Group: A smaller portion of the respondents (10%) has been working remotely for a period of 6 months to 1 year.

Fig 8: Evaluation of Home Workspace Infrastructure

This section explores the physical environment of the respondents, assessing whether they possess a designated area for professional tasks, which is a key determinant in remote work efficiency and employee well-being.

Data Distribution

- Primary Infrastructure: Over half of the participants (56.7%) confirmed they have a dedicated workspace at home. This suggests that a majority of the sample has made physical adjustments to accommodate long-term remote or hybrid work.
- Lack of Formal Setup: A significant minority of 50% reported not having a dedicated workspace. These individuals likely utilize multi-purpose areas (such as dining tables or living rooms) for their professional duties.
- Ambiguous Status: The remaining 13.3% responded with "Maybe," which may indicate a temporary or semi-private setup that is not exclusively used for work.

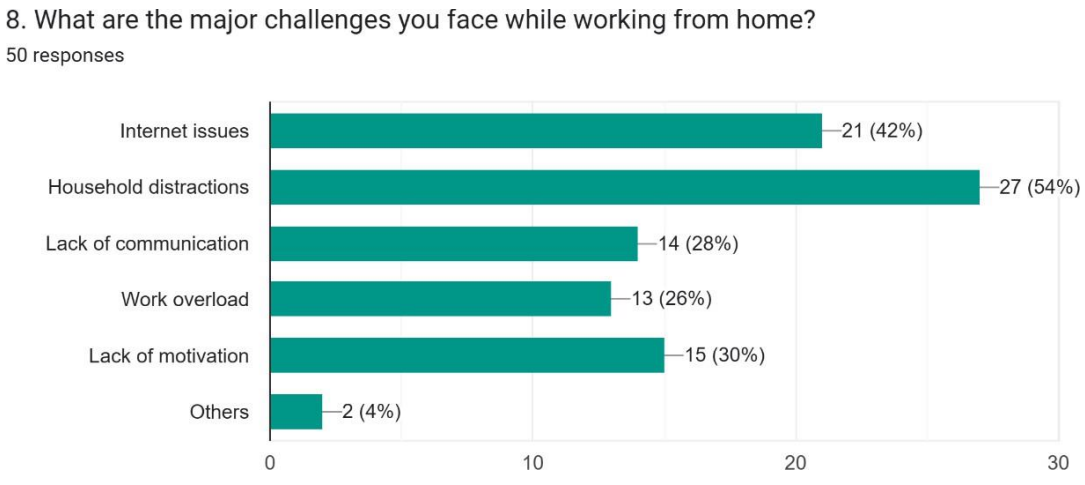

**Fig 9: Analysis of Remote Work Challenges**

This section explores the various logistical, psychological, and technical barriers that hinder employee performance in a work-from-home (WFH) environment. Identifying these hurdles is essential for developing targeted HR interventions.

Primary Obstacles and Frequency

- The Leading Challenge: Household distractions were cited by a significant majority of respondents (63.3%), making it the single most common barrier to productivity. This underscores the difficulty many employees face in maintaining a professional boundary within a domestic setting.
- Technical and Psychological Barriers: Internet issues and a lack of motivation tied for the second most prevalent challenge, each affecting 36.7% of the participants. These factors highlight both infrastructure dependencies and the mental health toll of isolation.
- Communication Gaps: Exactly one-third of the sample (33.3%) identified a lack of communication as a major hurdle, suggesting that virtual collaboration tools may not fully bridge the gap left by in-person interaction.
- Work-Life Imbalance: Work overload was reported by 23.3% of respondents, indicating that for nearly a quarter of the workforce, the absence of an office environment may lead to extended hours or increased task density.

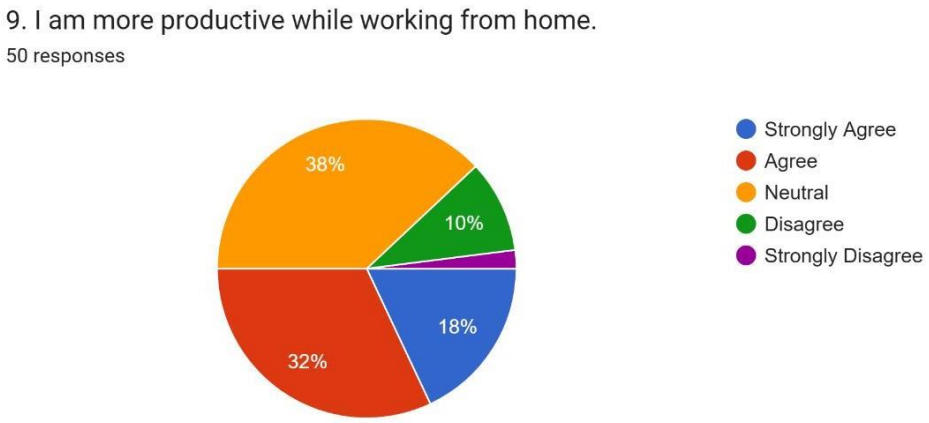

**Fig 10: Analysis of Perceived Productivity in Remote Settings**

This section evaluates how employees perceive their personal efficiency when working from home compared to traditional office environments. The results indicate a complex sentiment, with a significant portion of the workforce remaining undecided on the benefits of remote productivity.

**Sentiment Distribution**

- The Undecided Majority: Exactly half of the respondents (50%) maintained a Neutral stance regarding their productivity. This suggests that for a large segment of the workforce, the transition to remote work has neither significantly hindered nor exceptionally boosted their output.
- Positive Perception: A combined 36.7% of the sample feels more productive at home, with 50% agreeing and 6.7% strongly agreeing with the statement.
- Negative Perception: Conversely, 13.3% of respondents disagree that they are more productive in a home setting, indicating that the remote model may be less effective for certain individuals or roles.

**Fig 11: Evaluation of Task Efficiency in Remote Work**

This section examines the respondents' self-perceived ability to execute tasks efficiently within a remote framework. While productivity (as seen in the previous metric) measures overall

output, efficiency focuses on the speed and quality of task completion relative to the effort exerted.

Sentiment Distribution

- Predominant Neutrality: Over half of the participants (55.2%) expressed a Neutral opinion regarding their efficiency at home. This reinforces the idea that for many, the shift to remote work has not resulted in a definitive change in how they manage their workload.
- Positive Consensus: A combined 37.9% of respondents feel more efficient in a WFH setup, with 24.1% agreeing and 13.8% strongly agreeing. This group likely benefits from fewer workplace interruptions or the ability to tailor their environment to their workflow.
- Negative Sentiment: A small minority (approximately 6.9%) disagreed, indicating that for them, the remote setup is less efficient than a traditional office.

**Fig 12: Comparative Analysis of Workplace Distractions**

This section evaluates the environmental quality of a work-from-home (WFH) setup by comparing it to the perceived interruptions found in a corporate office. The findings highlight a polarized experience among respondents regarding their ability to maintain focus.

Sentiment Breakdown

- Majority Positive/Neutral: A combined 40% of participants feel they face fewer distractions at home than in the office (33.3% Agree and 6.7% Strongly Agree). Meanwhile, 36.7% of respondents remained Neutral, suggesting that for them, the nature of distractions has changed but the frequency remains similar.
- Negative Sentiment: A notable 23.4% of the sample disagrees with the statement, with 16.7% Disagreeing and 6.7% Strongly Disagreeing. For these individuals, the home environment is perceived as more disruptive than a professional office.

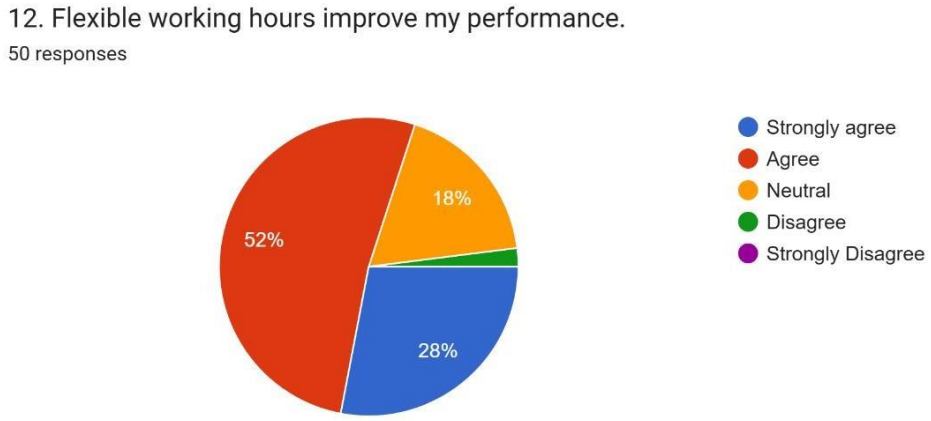

**Fig 13: Impact of Temporal Flexibility on Employee Performance**

This section examines the correlation between flexible scheduling and perceived work quality. The data reveals a strong positive consensus, suggesting that autonomy over one's schedule is a primary driver of professional output in the modern workforce.

Sentiment Distribution

- Strong Positive Consensus: A substantial majority of respondents (73.4%) believe that flexible working hours enhance their performance. This includes 56.7% who Agree and 16.7% who Strongly Agree.
- Neutral Positioning: Roughly one-quarter of the participants (23.3%) maintained a Neutral

stance, indicating that for them, the timing of work may be less impactful than other environmental factors.

- Negligible Dissent: A very small fraction of the sample (3.3%) Disagreed with the statement, while 0% Strongly Disagreed, suggesting that flexibility is rarely viewed as a detriment to performance.

**Fig 14: Psychological Impact: Motivation in Remote Work**

This section evaluates the internal drive and engagement levels of employees when separated from a traditional office environment. Motivation is a critical pillar of Human Resource management, directly influencing both performance outcomes and long-term employee

retention.

**Sentiment Distribution**

- Predominant Positive Sentiment: A significant majority of the participants (55.2%) reported feeling motivated while working remotely. This group is comprised of 41.4% who Agree and 13.8% who Strongly Agree, suggesting that for more than half the sample, the remote model is conducive to maintaining professional drive.
- Neutral Outlook: Nearly one-third of respondents (31%) maintained a Neutral stance. This indicates that for a substantial portion of the workforce, the work environment does not significantly swing their motivation in either direction.
- Negative Sentiment: A combined 13.8% expressed a lack of motivation, with approximately 10.3% Disagreeing and 3.5% Strongly Disagreeing that they feel motivated in a remote setup.

**Fig 15: Assessment of Work-Life Balance in Remote Frameworks**

This section explores the impact of work-from-home models on the boundary between professional obligations and personal well-being. Achieving a sustainable equilibrium is often cited as a primary driver of employee retention and mental health in decentralized work environments.

Sentiment Distribution

- Overwhelming Positive Consensus: A dominant 73.3% of participants reported a positive experience regarding their work-life balance. This group consists of 50% who Agree and 23.3% who Strongly Agree that they can maintain a healthy boundary.

- Neutral Perspective: A smaller segment of the sample (16.7%) remained Neutral, suggesting that for some, the transition has neither improved nor significantly damaged their personal time management.
- Challenges in Boundary Setting: A combined 10% of respondents expressed difficulty, with approximately 6.7% Disagreeing and 3.3% Strongly Disagreeing with the statement.

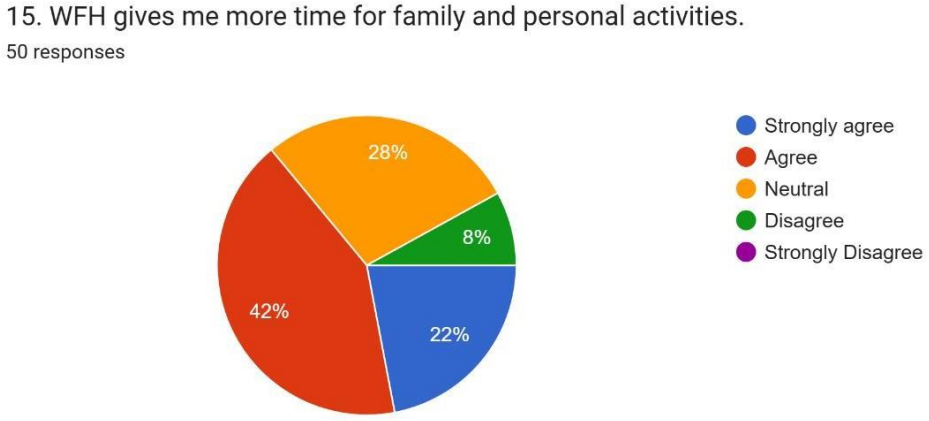

**Fig 16: Impact of WFH on Personal and Family Time Allocation**

This section evaluates the perceived "time dividend" provided by remote work models. By eliminating traditional office commutes and rigid on-site presence, the Work-From-Home (WFH) model aims to restore personal time to the employee, a factor heavily linked to job satisfaction and reduced burnout.

Sentiment Distribution

- Major Positive Consensus: A substantial 63.3% of respondents agree that working from home has increased their availability for family and personal interests (50% Agree and 13.3% Strongly Agree).
- Neutral Sentiment: Nearly one-third of the participants (50%) remained Neutral, suggesting that for this group, the time saved may be being reabsorbed by work tasks or other logistical responsibilities.
- Minimal Negative Impact: Only a small minority (6.7%) Disagreed with the statement, while 0% Strongly Disagreed, indicating that remote work almost never results in *less* personal time than an office-based role.

**Fig 17: Analysis of Boundary Blurring and Role Conflict**

This section evaluates the psychological and logistical difficulty employees face in "switching off" from work when their professional and domestic environments are geographically

identical. The ability to distinguish between these roles is essential for preventing burnout and maintaining long-term employee engagement.

Sentiment Distribution

- Significant Challenge Identified: Nearly half of the respondents (46.7%) admitted to struggling with role separation. This group includes 43.3% who Agree and 3.4% who Strongly Agree that it is difficult to detach work from personal life.
- Neutral Positioning: Exactly 50% of the participants remained Neutral, suggesting that while they may not face a constant struggle, they do not find the separation naturally effortless.
- Effective Boundary Setters: A combined 23.3% of the sample reported no significant difficulty in maintaining boundaries, with 20% Disagreeing and 3.3% Strongly Disagreeing with the statement.

**Fig 18: Comprehensive Analysis: Remote Work Models and Performance Outcomes**

**Workforce Composition and Environment**

The study represents a varied professional demographic, with interns making up one-third of the sample, complemented by equal representation from full-time and self-employed individuals. While the majority of participants hail from the Marketing and IT sectors—industries naturally suited for digital environments—nearly 77% already operate in remote or hybrid capacities. Despite this high adoption rate, the transition remains relatively fresh for 63.3% of the group. This "newness" is reflected in their physical infrastructure, as nearly a third of the workforce still lacks a formalized home office setup, potentially influencing their long-term adaptation.

**Efficiency and the Flexibility Factor**

Performance metrics indicate a state of "neutral equilibrium." While roughly half the respondents reported no significant change in their productivity or efficiency levels, a striking 73.4% identified flexible scheduling as a primary driver of improved performance. This suggests that the primary value of remote work lies not necessarily in the change of location, but in the autonomy over one's

time. However, this benefit is often countered by domestic realities, as household distractions remain the most prevalent barrier to deep focus, affecting over 60% of the participants.

**Well-being and the Boundary Paradox**

The remote model shows its most significant success in the realm of personal well-being, with over half the sample reporting lower stress and higher motivation levels. Approximately 63% of respondents noted a "time dividend," gaining more hours for family and personal pursuits. Yet, a "boundary paradox" exists: while 73.3% claim a healthy work-life balance, nearly 47% struggle to mentally disconnect from professional tasks. This indicates that while remote work provides the *physical* time for personal life, the psychological separation between home and office remains a significant hurdle for nearly half the workforce.

**Fig 19: Analysis of Respondent Demographics and Overall Impact**

The research shows that remote work is a relatively new transition for 63.3% of the surveyed group, having started within the last six months. While 50% remain neutral regarding productivity shifts, 36.7% have observed tangible gains in their output, largely attributed to the 73.4% who find that flexible scheduling enhances their performance. Nevertheless, domestic challenges persist; 63.3% cite household distractions as a hurdle, worsened by the fact that 50% operate without a dedicated office space. This lack of physical boundaries likely fuels the 46.7% who struggle to mentally disconnect from work. Despite these friction points, the model's greatest success lies in employee well-being, with 73.3% maintaining a healthy work-life balance and over half reporting lowered stress levels. Consequently, remote work currently appears more effective as a driver for psychological wellness and retention than as a primary engine for increased productivity.

**Fig 20: Analysis of Work-Life Balance in WFH Environments**

The survey results from 50 participants reveal a predominantly positive outlook on work-life balance in a remote setting, with a significant 70% majority rating their experience as "Good." When combined with the "Excellent" ratings, nearly 77% of the sample reports a successful integration of professional and personal responsibilities. Notably, the complete absence of "Poor" ratings suggests that the work-from-home model effectively prevents severe burnout or boundary conflicts for this group. However, the 23.3% who reported an "Average" balance indicate that while the setup is functional, there remains a subset of the workforce that could benefit from further organizational

support to fully optimize their remote experience. Overall, the data underscores WFH as a highly effective arrangement for maintaining employee well-being.

**Fig 21: Concerning future preferences for Work From Home**

The survey results concerning future preferences for Work From Home (WFH) demonstrate a strong inclination toward remote arrangements, with a 53.3% majority explicitly favoring its continuation. While over half the respondents are committed to this model, a significant 40% expressed uncertainty by selecting "Maybe," suggesting that their preference might depend on hybrid flexibility or specific organizational support. In contrast, only a small fraction (approximately 6.7%) indicated a desire to move away from WFH entirely. This data highlights a clear shift in workforce expectations, where the vast majority of employees are either fully supportive of or at least open to remote work as a permanent fixture, leaving traditional office-exclusive models with very little support among the sampled group.

The analysis of primary data collected from 50 respondents provides a comprehensive understanding of how Work-from-Home (WFH) models influence employee performance, particularly in terms of productivity and work-life balance. The findings reveal that WFH has a **mixed yet largely positive impact**, with variations driven by individual conditions, organizational support, and environmental factors.

## 5. Conclusion

The transition toward remote work represents a fundamental shift in corporate structure, moving beyond a temporary fix to a permanent evolution in how performance is measured. This research indicates that while work-from-home (WFH) models significantly boost productivity through increased autonomy and the elimination of traditional office distractions, these gains are not guaranteed. Success depends heavily on the integration of robust digital

tools, clear role expectations, and the employee's capacity for self-regulation.

A central finding of this study is the inextricable link between work-life balance and sustained output. Although remote work offers flexibility, the blurring of professional and personal boundaries can lead to burnout and "role overlap" if left unmanaged. The research suggests that work-life balance should not be viewed as a secondary perk but as a primary driver of long-term efficiency and employee engagement.

Organizational support emerges as the most critical variable in this dynamic. Success is largely dictated by leadership styles that prioritize trust over surveillance and provide transparent communication alongside necessary technical infrastructure. Organizations that fail to offer this support often see the benefits of WFH negated by employee isolation and disengagement. Ultimately, the study concludes that a "one-size-fits-all" approach to remote work is ineffective due to diverse individual needs and home environments. To remain competitive, modern organizations must adopt inclusive, outcome-oriented policies that focus on employee well-being. By fostering a culture of flexibility and continuous adaptation, businesses can transform WFH from a logistical challenge into a strategic advantage for sustainable growth.

### 5.1 Future Scope

While this study offers valuable perspectives on the intersection of remote work and employee well-being, the findings serve as a foundation for broader academic inquiry. A primary limitation of the current research is its reliance on a localized sample; therefore, future investigations should prioritize larger, more diverse datasets spanning various industries and demographics to enhance the generalizability of the results.

Beyond sample size, there is a critical need for longitudinal research to assess the long-term impact of work-from-home (WFH) models on career progression, organizational loyalty, and sustained mental health. Comparative studies between fully remote, hybrid, and traditional office environments would further clarify which structures best optimize performance without sacrificing employee wellness. Additionally, the rapid integration of artificial intelligence and advanced collaboration tools warrants exploration into how technology can be leveraged to streamline communication while mitigating digital burnout.

Future research should also delve into the psychological dimensions of remote work, such as the influence of personality traits and self-motivation on productivity. At the institutional level, investigating how leadership styles—ranging from transformational to servant leadership—translate to virtual spaces will be essential for modern management. Finally, analysing team cohesion and organizational culture in the absence of physical proximity remains a vital area of study. By bridging these theoretical gaps through diverse case studies and practical frameworks, future research can guide organizations in building resilient, human-centric workplaces in an increasingly flexible professional landscape.
