ABSTRACT:

The increasing pressures of deadlines, workload, organizational expectations, and personal responsibilities make work-life balance an important concern for employees and organizations. This study examines the impact of work-life balance on employee satisfaction, behavior, performance, health, and organizational commitment. Long working hours, excessive workload, rigid work structures, unrealistic expectations, and high work pressure can lead to stress, fatigue, and burnout, negatively affecting employee satisfaction and performance. The study also highlights the importance of organizational climate and management style in maintaining a healthy work-life balance. Supportive managers who understand employee needs, encourage communication, and provide flexibility can create a positive work environment. The study also emphasizes the role of technology and flexible work practices, such as telecommuting, in helping employees manage their professional and personal responsibilities effectively.

Keywords: *Work-life Balance, Satisfaction of Employees, Employee Performance, Work Stress, Employee Well-being, Organizational Behaviors, Work Environment.*

Chapter-1

Introduction

1.1 Background of The investigation

Work-life balance is one of the essential factors that are relevant in the lives of today's employees due to the highly dynamic environment of the present workplace. Many employees might face challenges in maintaining work-life balance.

1.2 Research Question

Many employees fail to create a healthy balance between their personal and professional lives owing to increased pressure at work. Lack of balance in the lives of employees results in a number of problems such as stress, fatigue, inefficiency, and lack of satisfaction in work.

1.3 Purpose of The "study"

1."To explore the relationship between work-life balance and employee satisfaction.2".To" identify the causes behind the inability to maintain work-life balance among employees.3".To" examine the relationship between work-life balance and employee motivation.4.To explore the influence of flexible working hours on employee productivity and satisfaction".5."To offer some suggestions related to work-life balance.

1.4 Research Questions

1. What is the notion of work-life balance, and how is it significant for employees?

2. What effect does work-life balance have on employee satisfaction?

3. What influences work-life balance in the organizations?

4. How do flexible working arrangements affect employee satisfaction and performance?

5. What actions can organizations take in order to promote work-life balance among their employees?

1.5 Scope of the Research

The present research paper will seek to examine the effects of work-life balance on the satisfaction of employees. The study looks into the influence of various factors such as workload, office hours, stress and flexible working, among others, on the degree of employee satisfaction.Importance of The InvestigationThe current research is important since it assists in comprehending how the balance between work and personal life impacts the happiness of an employee. The current working conditions of today are very hectic and

stressful for an individual to handle.Conceptual framework of The current study describes the effect of work-life balance on happiness of the employees. At present, employees are struggling to find harmony between their work-life and personal "life".Work-life balance in The current study refers to the independent variable while employee happiness is the dependent variable. Flexibility in working hours, cooperative administration, balanced work load, and policies regarding leaves are few significant elements that contribute to employees' harmonization between work and personal lives.Harmony between the two has positive effects on the mental well-being of the employees. Happy employees are less stressed, productive, build healthy relations with their peers, and develop organizational loyalty.As per the conceptual framework, there is a positive correlation between work-life balance and employee happiness. Those employers who provide good policies for their employees can make sure about the happiness and productivity of their employees.

Chapter-2

2. Literature Review

2.1 Theories on work-life balance

There have been many different theories on work-life balance formulated in the late 1980s to help explain the relationship between work and personal lives. There have been many different theories on work-life balance.

2.2 Compensation theory

The essence of the compensation theory is that workers tend to compensate their shortages in one area by compensating something in another sphere (work-family) (Lambert, 1990). As mentioned by Piotrkowski (1979), family sphere served as a sanctuary for men allowing them to fulfill what was lacking from the sphere of working life.

2.3 Spillover theory

Spillover theory can be viewed as one of the best known concepts about the relationship between work and family spheres. Positive and negative spillovers are possible.

2.4 The Work/Family Border Theory

Clark (2000) proposed the application of border theory to examine the work-life balance issue. The theory implies that people possess certain areas of their lives which are differentiated by geographical, temporal or psychological borders.

2.5 Resource Drain Theory

Resource drain theory proposes that individuals have a finite pool of resources—time, money, attention—and allocate them across work and personal domains. When resources are channeled into one domain, less remains for the other, including personal or community activities (Edwards and Rothbard, 2000).

2.6 Segmentation Theory

Segmentation theory treats work and personal life as entirely distinct domains that do not influence or overlap with each other. It holds that the two roles operate independently and do not bleed into one another (Edwards and Rothbard, 2000; Zedeck, 1992).

2.7 Work-Life Integration Theory

In accordance with the theory of integration, the existence of a healthy system along with adaptable and open boundaries may be beneficial for both personal and working spheres (Clark, 2000). In order to adopt the theory of integration, one needs to develop a modern view on the connection between the aspects of professional activity and private life, taking into consideration all relevant parties, namely the employer, employee, and community as a whole. All parties are supposed to participate equally in the process of modeling work-life integration (Morris & Madsen, 2007).

The concept of work-family enrichment was suggested by Barnett & Hyde in 2001. The essence of the notion lies in the fact that the engagement in multiple work and family activities may positively impact the physical, psychological and interpersonal well-being of a person owing to additional income and/or social support. Multiple role engagement becomes complicated when there are too many roles to cope with.

Chapter-3

Problems Identification

3.1 Work-Life Balance versus Employee Satisfaction

A cross-sectional study conducted by Makabe et al. (2015) on the ideal work-life balance of 1,201 nurses in acute-care hospitals across Japan was analyzed for the ideal balance, personal and work satisfaction, quality of life, and stress management.

The three factors that are responsible for an imbalance in work and personal life, according to Guest (2002), are:

In certain industries, such as technology and customer service, where 24/7 operations take place, there is constant pressure. Increased workplace demands have resulted in an imbalance.

Trends within society such as single parents and individualized families have contributed to concerns over home life quality. The increased workload has led to limited engagement in personal activities and thus causes an imbalance.

Work-related norms and attitudes also play a role in creating imbalances. An imbalance arises from a conflict between personal life and work.

According to Azeem & Akhtar (2014), practices such as performance appraisal, promotion criteria, compensation system, working conditions, and administration relations also contribute significantly to determine employee satisfaction. An obvious and substantial positive relationship can be established among all these practices, while performance and promotion practices were found to be relatively more influential.

A great deal of literature and justification exist for the link between work-life balance and employee satisfaction. However, due to the complexity of the concept of work-life balance, there is no clear definition of what exactly the concept entails.

Not consistent in various industries and organizations.

Absence of organizational policy support.

Absence of employee participation in work-life balance programs formulation and implementation.

Formulation and implementation of work-life balance programs only serve organizational interest, not the interests of employees.

Failure to reduce work-related duties within the workplace.

Overt and covert intrusions at home by work responsibilities.

Domestic pressures continue to persist for women regardless of their employment and job level. From the study, it is clear that many employees continue to face problems of balancing work and domestic obligations.

Flexible working schedules have been examined in relation to their impact on employee satisfaction by McNall et al. (2010), with the findings showing that employees are more satisfied when there is such flexibility in their work system.

Figure 1: Conceptual framework of The investigation. Literature points to a significant connection between work-life balance and employee satisfaction.

3.2 Empirical study

Methods of discussion and analysis used in the investigation, The Investigation, are introduced in this chapter. This begins with an introduction to the organization chosen for The Investigation by first introducing the design of the investigation, the population that was considered in The Investigation, the procedure that was used to gather information, the sampling technique used and the type of analysis that was conducted during the investigation. This chapter also explains the reliability and validity of the instruments that were used to gather information. Lastly, this chapter concludes with conclusions that were reached and recommendations based on the investigation.

Kuoni Tumlare is one of the highly-rated B2B tourism companies dealing with travel and destination management solutions for tourists and groups. Kuoni Tumlare assists holidaymakers and groups with packages tours through cooperation with wholesalers and retail travel agents all over the world who plan, make arrangements, and perform ground service functions to the company's customers.

The major company policy is treating everyone in an equal manner regardless of their race, place of origin, color, nationality, language, citizenship, religion, gender, sexual orientation, age, marital status, and physical or mental disability.

Employees should conduct themselves professionally and respectfully to their co-workers, customers, and partners. Employees can use mobile phones while working.

Chapter-4

Methodology

4.1 Investigation Design

The methodology utilized for the investigation is based on the principle of descriptive study design, and this makes it possible to examine the discussed topic on different levels. The investigation addresses questions and answers given by the subjects who correspond to the investigation aims. In particular, the investigation will address perceptions about work-life balance and the level of job satisfaction of these subjects.

The quantitative research design was applied in the investigation, which implies that about 160 employees were involved. The results were compared to the aim of the investigation.

The questionnaire was chosen as the main method of collecting data in the investigation. The questions were designed in such a way that answers would be objective and precise.

The investigation also addresses the problem under discussion in relation to organizational context. Prior investigations on the issue were selected because of their relevance and validity, and this made it possible to build upon them and proceed

4.2 Sampling Method

The selection of the sampling method is such that a sample can be identified for representing the population and also for achieving the set objectives of The Research Study. Two specific sampling methods have been applied in this sampling process.

While selecting the sample, consideration has been given to ensure the selection of employees from all departments so that everyone had equal chance of selection. Overall, a total of 160 people were selected from different departments of the organization.

A stratified sampling method has been used in this research study owing to the heterogeneity among the employees. Other considerations included those of employee availability, access (due to the similar working environment of the researcher), suitability of subject, and willingness to respond to the questionnaire.

4.3 Study Population and Sample Size

This research was carried out to determine the significance of work-life balance and its influence on the level of happiness among employees. In order to achieve the research objectives, quantitative techniques have been used in collecting information from the selected employees of Kuoni Tumlare through questionnaires.

The total population involved in the research amounted to 160 employees. In determining the sample size of this research, Taro Yamane technique was used. This is shown below;

Therefore, the 115 employees have been selected to obtain their perspectives on work-life balance and job satisfaction.

4.4 Data Collection Methods and Structure of Analysis

The research was conducted in accordance with a well thought-out plan, which aimed at providing reliability and validity of its findings in every aspect. Questions that appeared during the course of investigation were clearly stated and addressed to the purpose of the research. Data collection tools were divided into two types; first was focused on collecting information about the participants' demographics and second revealed the problem of work-life balance and general satisfaction from it.

investigation methods and analysis procedures were selected according to The investigation objectives. Descriptive statistics was employed to estimate the frequencies and percentages for ages, gender and occupations of the respondents, which were graphically represented in tables and figures.

4.5 Results and Discussion

This section is devoted to the presentation and discussion of The investigation results and consists of two parts. First part includes description of demographic characteristics of the participants, such as age range, gender and occupation. Comparisons of significance among demographic variables were made at the 0.05 significance level. Second part presents the answers.

Chapter-5

Information evaluation and Interpretation

5.1 Evaluation and Interpretation

In this section, statistical data about the demographics of the participants were analyzed. Regression and correlation analysis were then conducted to test the relationship between the dependent and independent variables.

From Table 2, it is clear that the demographic characteristic of Kuoni Tumlare employees was considered in selecting participants for the research. Among the total number of participants, males make up 36.9%, while females account for 63.1%.

Table 2: Profile of Sample Participants Demographics

In the provided sample, 35.2% of respondents were aged between 18-26 years, while 14.8% were aged between 36-44 years. As far as types of employment, the largest group comprised permanent workers totaling 82 individuals (67.2%) followed by temporary workers numbering 40 (32.8%).

5.2 Differences Between Individual Characteristics Associated with WLB and JS

The balance between employees' personal and professional lives along with their level of satisfaction from both of them is a vital topic not only for males but for females as well. Results found in research by Crompton & Lyonette (2006) concerning five countries in Europe (Great Britain, Finland, France, Norway, and Portugal) have shown that work-life conflicts were more pronounced in case of women than of men because of the former's higher participation in household matters.

Table 3. Variance Analysis on Gender, Age and Job Position with respect to WLB & JS (Author)

It appears from Table 3 that there was no significance from the point of view of WLB and JS in regard to the variable age. Likewise, there was no significance when considering the variable of job position since employees were classified into temporary/permanent employees.

No statistical significance was observed with regard to the comparison between males and females regarding their employee satisfaction assessment. In other words, gender, age, and job position had no significant impact on evaluating the variables of WLB and JS.

Evaluation of responses about Factors of Balance Between Work and Personal Life of Staff Members

Table 4 provides responses of participants on the factors of balancing work and personal life according to the questions asked from them. In this regard, the rating scale used for evaluating the responses is five-point Likert scale.

For instance, while asked if the respondents generally take short breaks while at work, 82% of the respondents replied that they indeed took short breaks because they needed them. However, 18% respondents responded that they did not need to have breaks as they enjoyed working without interruption. Furthermore, on an average, 15% of total respondents were reluctant to give any opinion on this factor.

Table 4. Evaluation of respondent to WLB (Author)

Table 4. Evaluation of respondent to WLB (Author)

Moreover, approximately 48% of the respondents believed that their daily responsibilities did not need additional hours in office while 21% worked additional hours. Also, 31% of respondents gave no response on this issue.

In terms of having adequate time with the family during work, 60% feel that they had adequate time with the family even while working, while 16% were neutral on this matter, but 24% mentioned they felt their time with family was unsatisfactory.

In terms of coping mechanisms for stress, 45% of respondents perform yoga, meditation, and exercising at the gym, while 36% of them did not take part in such activities, and 19% did not know what to say about this matter. As for changing one's place of work, 37% were neutral, 34% believe that they would change their workplace if there were an opportunity to do so, and 29% are satisfied with their workplace.

Importance of positive work-life balance for health-related issues is reflected in the fact that 85% feel it is important to maintain it, while only 4% disagreed, and 11% were neutral. In terms of whether work interferes with spending quality time with their family and friends, 33% feel it does, but 44%.

Chapter- 6

Results & Discussion

6.1 Factor Evaluation

Kuoni Tumlare is one of the leading B2B travel and tourism management companies. The firm helps vacationers and travel groups via package tours in the cooperation of wholesalers and retailers in making the package tour arrangements and provision of ground services in the world.

The policy of Kuoni Tumlare is that all people deserve to be treated equally irrespective of whether he or she is white, black, of any nationality or color, has a different language, a certain religious belief, is of the opposite or same sex, young or old, married or single, and mentally or physically disabled.

The employees must be professional when dealing with each other, clients, and business partners. It is acceptable for employees to use cell phones at work.

Table 7 represents the factors that were extracted. As indicated by the table entitled "Rotation Sums of Squared Loadings," only those factors which had a value greater than the criterion were considered (i.e., the method of extraction).

Below is shown a table showing the Extraction Sums of Squared Loadings and the Rotation Sums of Squared Loadings of seven factors. Lastly, a table of the Rotated Component Matrix is shown below in Table 8.

As observed from the above table, seven factors were extracted. These represent the factors that are most significant to an analyst. Using the factor loadings (where a value greater than 0.5 represents a factor loading), these include:

The variables in the first factor include 12 items such as family time, leave policy, family care leave, work-life balance, individual success, equal treatment at work, support, meeting friends while working, work

conditions, working hours, spare time from work and personal activities, and overall happiness. Since all the above variables are about time, the factor is labeled as "time management." It can be said that time management is a very crucial factor in improving the work-life balance and making workers happy.

The second factor includes four variables including organization safety policies, individual well-being, organizational success, and work-life balance as the reason for worker happiness. All these variables focus on the organizational practices and views and therefore, are collectively referred to as "work-life balance procedures." The impact of work-life balance procedures is felt on organizational success, referrals, costs, output, and worker retention.

Table 8: Rotated Component Matrixa

The third factor includes three elements such as flexible work schedule, quick break, and family time after working hours. The group of elements reflects time elasticity.

The fourth factor consists of four elements. These four elements include time quality, happiness, high salary, and balancing life.

The fifth factor includes just one element. It involves fight in the office.

The sixth factor includes three elements such as overtime work, working pressure, and job stress.

The seventh factor includes various elements which are associated with work. In this case, the actual element would be boring work.

6.2 Correlation evaluation

Correlation represents a statistical approach used to find out whether there is any connection between two factors and can be positive or negative. The correlation values analyzed below have ranges varying between -1 and +1.

Table 9. Evaluation of the correlation

When estimating correlations between the balance between work and personal life and factors of employee contentment, all of the variables were significantly correlated. However, the variable showing flexibility concerning the office hours was correlated with personal achievements (correlation coefficient is equal to 0.507), significance equals 0.01.

The variable of taking short breaks showed moderate significance when being connected with employee contentment variables ($r < 0.5$). The most important correlation coefficient was 0.366, referring to physical conditions at the place of work.

Work after office hours is not significantly correlated with employee contentment meaning that extra hours have no influence on the degree of employees' satisfaction. It is very important for companies to cope well with problems causing unethical requirements for working overtime as it actually influences the factor of employee contentment.

There was a strong correlation between family time after work and personal success ($r = 0.577$), physical work hours ($r = 0.536$), work/personal time balance ($r = 0.654$), and general happiness ($r = 0.550$). Nevertheless, the strongest correlation coefficient was found to exist between family time after work and work/personal time balance.

The correlation coefficient between supportive workplace culture and respect from administration to staff members was highly significant (0.01) ($r = 0.527$). The significance of this result shows that to have happy and satisfied employees, one should motivate supervisors as well as administration that will treat them well, making the latter feel more motivated and happier about the job. This way, it will be beneficial for the company since there will be low turnover rate and good reputation among other candidates.

There was a negative correlation between variable "searching for new positions" and personal success ($r = -0.227$), salary ($r = -0.322$), fairness ($r = -0.272$), supervisor support ($r = -0.266$), referral of friends ($r = -0.302$), and physical working conditions ($r = -0.190$). Variable "referral of friends" showed that employees were happy and felt comfortable recommending their company to friends.

Work-life balance is also known to exhibit strong and significant relationships with many different aspects of the satisfaction levels of employees like accomplishments, supervisory motivation, work environment of employees, time management for work as well as personal life, and job satisfaction. The correlation coefficient between the two most highly correlated variables worked out to be 0.676.

As far as correlation between the work-life balance and the satisfaction of the employees is concerned, it appears that all variables related to work-life balance showed either positive or negative correlation with some variable(s) of employees' satisfaction at the level of significance of 0.05 and 0.01. It means that different variables were responsible for creating such correlations. Knowledge of these variables would help pinpoint areas where motivation can help.

Table 10. Correlation evaluation of balance between work and personal life and employee contentment (Author)

		Job Satisfaction
Work Life Balance	Pearson Correlation	**.657****
	Sig. (2-tailed)	.000
	N	122
****. Correlation is significant at the 0.01 level (2-tailed).**		

The purpose of the correlation analyses result presented in table 10 is to gain insight into the nature of the relationship among the variables – work life balance and employee contentment of staff members. the positive relation has been shown by the investigation between balanced work life and employee contentment

Figure 2: balance between work and personal life and employee contentment graph

The correlation evaluation in Table 10 sheds light on the nature of the relationship between balance between work and personal life and employee contentment. The investigation confirms a positive relationship between the two: the correlation coefficient r = 0.657 (p = 0.000) is above +0.5, indicating a strong positive relationship.

Table 11. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	**.657a**	.432	.427	.44304
a. Predictors: (Constant), Work Life Balance				

a. Predictors: (Constant), Work Life Balance

Table 11 shows the model summary of the regression between the dependent variable (employee contentment) and the predictor (balance between work and personal life). The R-squared value of .432 indicates that 43.2% of the variation in employee contentment is explained by balance between work and personal life.

6.3 Table 12. ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	17.895	1	17.895	91.929	**.000b**
	Residual	23.554	121	.195		
	Total	41.449	122			

a. Dependent Variable: employee contentment

b. Predictors: (Constant), balance between work and personal life

The ANOVA table confirms that the regression model is statistically significant in predicting employee contentment ($p < 0.05$). This confirms that the overall model is both valid and well-fitted, and that balance between work and personal life has a positive and significant effect on employee contentment.

Table 13. Coefficient of Regression Table of WLB and employee contentment (Author)

Model	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	.435	.037		2.371	.013
Work Life Balance	.844	.088	**.657**	9.548	**.000**

a. Dependent Variable: employee contentment

The significance values for both variables fall below 0.05, confirming they are a good fit for this model. The standardized coefficient (beta) values for the independent variables are below 0.5, indicating that changes in any individual balance between work and personal life indicator produce a relatively modest effect on employee contentment.

balance between work and personal life therefore has a meaningful influence of 0.657 on employee contentment. Taken together, the analyses confirm that balance between work and personal life does genuinely shape, and has a considerable effect on, staff members' employee contentment within the organization.

6.4 Factors Determining balance between work and personal life and employee contentment

A range of factors influence balance between work and personal life, and different researchers describe them in different ways. Authors generally agree that these factors can be tied to the individual, the family, and the workplace.

Table14: Frequency and descriptive statistics of responses towards the WLB variables

Work-life variables	%	Mean	Std. Deviation
Organization's workplace safety policies match up with working conditions (Fire & Safety precautions, Safety at work during pregnancy).	86.00	4.20	.792
Does office provide leave if you need to take care of your children or dependents?	67.00	3.98	.818
There is supportive culture with in staff members to finish tasks (boss/colleague)	74.00	3.97	.881
Do you think that there is flexibility of working hours in your company?	65.00	3.66	1.161
Are you looking for new vacancies these days?	34.00	3.07	1.115
Do you have more pressure of work?	34.0	3.07	.951

	0		

Note: % indicate the total responses respondents of work-life variable with point 4 and 5;

i.e. agree and strongly agree.

n other words, if an employer can guarantee their employees' safety, it will help them manage their work better.

These actions will let employees apply appropriate means in managing both their professional and personal matters that can contribute to effective balance. Obiageli et al. (2015). Seventy-four percent of respondents reported having a supportive culture among their colleagues and management team regarding completing work assignments.

Also noted was the fact that sixty-five percent of respondents have office hour flexibilities at their company, which proves the existence of yet another determinant for the balance between work and personal life – flexible scheduling.

Another determinant that affects the balance between work and personal life was the work pressure, whereby thirty-four percent of the respondents confirmed that they were under work pressure. In such situation, one possible remedy for the company is to assign tasks according to individual strengths of employees and to inform them about their expectations.

Figure 3: Determinants of balance between work and personal life.

In case of failure to achieve balance between work and personal life activities, this issue becomes the main determinant for the employees. Consequently, failure to reach this balance leads to dissatisfaction of the employees.

Figure 3. Factors influencing to the balance between work and personal life.

balance between work and personal life is the most consequential factor for staff members. The absence of effective balance between work and personal life activities directly reduces employee contentment.

Table 15: Respondent percentage and descriptive statistics of responses towards the Job

Job Satisfaction Variables	%	Mean	Std. Deviation
You are treated well by management?	77.00	3.73	.996

In the organization, the working hours are satisfactory	70.00	3.85	.933
Progress and satisfaction of working will be increased by balanced work life policy	65.00	3.79	.902
Supervisors are encouraging you to be best	64.00	3.68	1.062
Physical working condition in your organization is satisfactory	62.00	3.71	949
Personal accomplishment has been felt by your working in the organization?	58.00	3.58	1.051
Backbiting and fighting is the part of the organizational working activities.	54.00	2.34	1.104
You are well paid for your effort at work?	46.00	2.73	1.164
Note: % indicate the total responses respondents of work-life variable with point 4 and 5; i.e. agree and strongly agree.			

Table 15: Percentage of respondents and descriptive statistics of answers related to the Job

The most significant determinants that influence the employees' contentment according to Table 15 are:

Behavior of administration toward the employees received the highest percentage of responses (77%), showing that the behavior of the administration is crucial in determining the emotions felt by the employees toward the company.

The working hours were second with 70%, whereby studies indicate that the satisfaction of employees with the working hours determines their contentment generally.

Work-life balance was ranked as the third determinant of contentment with 65%, showing its importance in ensuring contentment and productivity among employees.

Physical work conditions of 62% of the participants were satisfactory.

Staffs are naturally inclined to have safe and healthy working environments.

Being successful on the job is cited by 58% of respondents as among the factors that can yield pride and job satisfaction for them. Workplace recognition and rewards point to the fact that there is trust placed by the company on its workers.

Conflict at the workplace emerges as the seventh motivation factor according to the survey results since 54% of the respondents did not agree with the idea of lots of conflict and animosity at work. It must be understood though that conflict always arises due to the diverse background of the company's workers.

The salary of a person working at the workplace is among the major sources of his or her satisfaction since all workers compare their salaries with others

Chapter-7

Conclusion & Scope of further work

7.1 Conclusion

In the present research study, the result that the balance between work-life has been observed to contribute in keeping the employees satisfied with their organizational performance. According to this observation, the employees having balanced personal-professional lives are more motivated, satisfied, and perform better at their jobs.

7.2 Recommendations

Based on the findings of The research study, the following recommendations are suggested for:

Flexible office timing and organizational policy support is necessary.

Encouragement for maintaining personal-professional balance is necessary.

Professional and psychological support from the management is needed by the employees. Proper management of workload is necessary.

Creating a congenial work environment is essential for organizational success.

7.3 Future scope of The research

The present study has been conducted using a limited number of samples, but further studies can be conducted using a larger number of samples to ensure precise outcomes. Some other areas in which future studies can be conducted are as follows:

Work-life balance policies in different industries and organizations.

Impact of remote working or telecommuting on the satisfaction of employees.

Impact of wellness initiatives of organizations on work-life balance.

Techniques for the assessment of employee satisfaction.
