STUDY ON TRAINING OF WORKFORCE, AND ITS IMPACT ON HOSPITAL PERFORMANCE & PATIENT SATISFACTION

Priyanshi Lohchab – Student
Department Of Management, Kalinga University, C.G., India
Dr. R. Shridhar, Vice Chancellor, Kalinga University, C.G., India

ABSTRACT:

Workforce training has been given emphasis as it enhances employee performance, efficiency of healthcare unit, and contributes to quality of care. In this paper, the significance of “workforce training” and its effect over the hospital’s performance and patient satisfaction is being examined. In healthcare sector, the organizations (mainly, hospitals) are made up of a diverse workforce that comprises of both the medical and non-medical staff and it is vital that training programs must meet the needs of all the categories to ensure efficiency in service delivery. On-the-job, off-the-job, technology based training, soft skills, etc. training programs escalate employees knowledge, skills, abilities, and attitudes which contributes to better teamwork, communication, and patient care practices. The center of focus of the research paper is “workforce training”, it emphasizes on the benefits associated with training programs that helps a hospital unit improves its functioning. Training programs not only escalates productivity, operational efficiency, but, also improves organizational responsiveness to changes, such as telemedicine, AI in healthcare system, robotics in healthcare system, etc. Additionally, training of employees builds interpersonal relation among team members, employer-employee, and workforce-patient which contributes to increase organizational trust, and gains patient trust. The paper presents the significance of training programs so that hospital can achieve highest possibilities.

Though, workforce training programs present numerous advantages it is still a difficult task to conduct. Difficulties and challenges can be faced from different ways; it may be internal management policies, lack of resources, insufficient funding, employee’s resistance to change, etc. It is important for hospital to deal with every challenge otherwise it will receive adverse outcomes. There are various ways to tackle such challenges like effective policies, management support, timely arrangement of funds, organizational flexibility, flexible work culture, etc. that will improve health outcomes. It is found that systematic, consistent, and effective training programs not only improves performance of healthcare personnel but also contributes to uplift patient satisfaction level. Hence, investing in “workforce training” is regarded as a strategic need for hospital which contributes to provide quality patient-centered care and attain organizational excellence.

Keywords: Healthcare workforce, Workforce training, Hospital performance, Patient satisfaction, Health sector

Introduction

The productivity, competence, and flexibility of the workforce have become a critical aspect of the overall health hospitals performance and patient satisfaction in the current healthcare landscape that is rapidly changing. Training of the workforce in healthcare sector is not just an administrative task but a strategic requirement. Well planned training programs help in improving knowledge, skills, attitudes, and behavior of employees which make them responsible in performing their duties more effectively and efficiently. The ultimate aim of workforce training is to influence the performance of hospitals, ensure quality services being delivered, and enhance the overall experience of patients under their care.

Healthcare organizations are complicated systems that consist of various professionals, such as promoters, CMOs, president, vice-president, doctors, nurses, pharmacists, paramedical personnel, technicians, administrators, finance officers, and support staff, etc. Each group has a distinct and interdependent role in the provision of care. Consequently, the need arises to have institutions investing in holistic training programs of all the levels of the hierarchy, all the way from the top management to 4th class employees. These programs may involve on-the-job training, off-the-job training, technological training, soft skills training, etc. These programs will help healthcare providers ensure all healthcare workforces are up to date on their knowledge, are skilled in using new medical evolving technologies and are able to effectively manage dynamic healthcare needs.

The significance of continuous training of the workforce has increased with the evolution of the medical technology and approach to patient care. New technologies such as telemedicine, artificial intelligence assisted diagnosis, and robotic surgery systems, etc. need to be incorporated into modern training programs for medical staff. Interdisciplinary collaboration training, cultural competence training, patient-centered care training will keep healthcare professionals ready to cater the requirements of patients. Although, significance of training is equally recognized and upholds a significant value, introducing successful programs is frequently extremely complicated. The continuous learning process may be hampered by limited financial and human resources, resistance to change among personnel, and a lack of institutional support. The way to overcome these barriers is to have a powerful organizational emphasis on professional development and develop learning and innovation culture in hospital setting.

Training of workforce does not only enhance the clinical outcome of the hospital in its operations but also directly and quantifiably impacts patient satisfaction that is the ultimate aim of healthcare service delivery.

The paper proves that employees who receive efficient training are more confident, communicate better and have empathy towards patients. As an example, training programs centered on the management of aggressive patient behavior or the enhancement of the nurse-patient relationship have been reported to positively affect the confidence rates of healthcare workers greatly and create a more supportive and safe care environment. Similarly, developing both front office and administrative personnel will improve their communication and service provision skills which will result in patient trust, comfort, and overall happiness.

Additionally, organized training programs in teams that include classroom training, simulation, etc. allow healthcare team to train essential teamwork and decision-making skills in a simulated setting. A hospital conducting training sessions, such as mock drills for emergency situations will help them determine how a team will react to the emergency. There are different emergency codes and the immediate team responding to them is also different, like code blue has been announced then a team of medical personnel have to immediately respond to the area. It will help management to find the efficiency and responsiveness of the team. Then, there are other emergencies also, like code pink, code red, etc. In this way we can easily understand how our hospital is performing. Hospital that are providing training sessions when this thing will somewhere come under the view of patients it will make them feel assured that the employees are aware of the changes.

Purpose of the Study

1. Training of the workforce in hospital setting assists the org. to advance knowledge, skills, attitudes, abilities, and behavior of employees by undertaking different training programs. This helps to boost the workforce productivity and finally assists the org. to achieve its objectives.
2. In healthcare industry, workforce includes physicians, nursing staff, pharmacists, pathologists, other clinical staff members, non-clinical staff, and supportive staff that are a multidimensional workforce. Training enables cohesiveness among employees. A hospital should offer required training to all employees of the unit right from the top management to the 4th class level employees to ensure that the performance of the employees can be enhanced and quality service can be delivered.
3. A hospital has numerous advantages of training its employees but it's a complex process to implement training as there are 'n' number of challenges that a hospital may face during the training process, like staff resistance to change, unavailability of resources to conduct the training program, etc. all these factors hinders the training program. Therefore, hospital should early recognize

challenges and combat them so they don't have to compromise with the performance of the hospital, and patient satisfaction level.

Objectives of the Study

1. To study about the workforce training in healthcare organization.
2. To understand the benefits and challenges associated with workforce training and how it affects the performance of hospital and analyze the conditions faced by hospitals in conducting workforce training.
3. To understand how training hospital personnel affects the level of patient satisfaction in hospitals.
4. To understand the significance of "workforce training" and its impact over the functioning of a healthcare unit.

Literature review

1. **(Nasser Ali Ahmed Alqaysi, 2024)** has mentioned that healthcare workforce is a crucial asset. Education and training of human resources in healthcare sector seems ineffective in preparing health professionals for the increasing demands in healthcare system. For example, training curriculum is accused of using old disease-driven practices, less integration of interdisciplinary teamwork and technological competencies or not sufficiently adopting patient-center approach. There are various improvements in healthcare sector, especially technological improvements. Modern training programs must include technical training as lack of technical skills in workforce pulls down the growth of hospital. The training programs will need to adjust the training on new healthcare technologies, interdisciplinary teamwork, and culture background.
2. **(Andri Yunus, 2024)** has stated that aggressive patients are a global problem and it cuts across all the healthcare professions. Behavior is difficult to predict, we cannot determine how different patients react to different situations. There are patients with calm and composed behavior, and also there are patients having aggressive behavior. Understanding the behavior of such patients helps nursing personnel to effectively handle them; these boost personnel's morale and confidence. Such training not only benefits workforce but also contributes to overall hospital performance. 'As during hospital stay, a patient spend most of its time with nurse therefore nurses need to be given necessary training in handling patients with proper care'. This can be achieved through better coordination, communication, understanding patient's safety, patient's rights, etc. 'The study observed that the

mean score of confidence among students prior to training was 2.2 that increased to 3.9 after training this demonstrates the necessity of training in healthcare sector’.

3. **(Serajedein Mohamed Mansour Shugman, 2025)** has stated that training is conducted through different modes. When employees perform their work then training is given through guidance. To educate employees on greater topics separate sessions are also conducted. So, training is important. It is the responsibility of hospital management to understand how suitable a training program is for the hospital so that maximum benefits can be achieved. “Training sets clear direction for employees. It encourages ethical practices in hospital to hold highest standards”.
4. **(Mayyadah Abotaleb Mohammed Alzain, 2024)** has stated that patient satisfaction can be achieved by having innovative working culture in the hospital. Patients give value to good communication maintained by every employee. “Innovation helps in making changes to achieve hospital success”. A hospital which continuously contributes in the training programs that are especially based on soft skills helps in to make sustainable healthcare service. Patient satisfaction helps to identify how a unit is providing quality. Hospital has to adapt to new practices to get more benefits.
5. **(Dana Milanovich Costar, 2020)** has mentioned that every employee get to learn while he performs his duties. To improve team performance of employees the hospital must conduct separate training sessions. Conducting training other than work helps to make employees aware regarding rules & regulations, and technological up-gradation. It also helps to prepare employees for a change. Apart from giving knowledge, training put employees in a situation that might occur in reality. These training help to identify how an employee manages it. Not only the individual response of employee, but how an employee collaborates with colleagues to manage the situation. “The research explains how team training provides teamwork skills, accelerate clinical efficiency, and increase patient safety”.
6. **(Anu. A. Natraj, 2025)** has stated that training front office personnel in a super specialty hospital would result in patient happiness. Training provides guidance to employees to perform their jobs. In hospital, employees have to keep on interacting with multiple patients. Reception staff maintains patient data and complete formalities. Doctors examine patients and cure them. Pharmacists provide medication as prescribed by doctor. Pathologists provide diagnostic reports. Like this, employees stay connected with patients. Among all employees, the first one with whom patient interact is front office staff. Their training focuses on enhancing patient end-to-end process from admission to discharge.

7. **(Khalid Masaad Saud Alharbi, 2023)** has mentioned that over the years we can see differences in older training model, and new modern training model. Training has been evolved from being a once in a while activity which was majorly confined to big organization to being a continuous activity and part of every org. irrespective of its size or location.

Research methodology

The current research study will rely on the secondary sources of data to explore the effect of workforce training on the functioning of hospital and to determine the level of patient satisfaction. The research is a combination of secondary data sources and interprets the existing available literature with the motive of drawing meaningful insights regarding the impact of training programs over the operation of hospital, and patient satisfaction. Input from the secondary data is generalized particularly to hospital. The motive of conducting this research study is to gain meaningful insights regarding “workforce training”.

Data analysis

In hospital setting, “workforce training” is a process of improving knowledge, skills, attitude, and behavior of employees at every stage of employment, right from the top management to supportive staffs. The objective of conducting training program is to ensure that along with being qualified, efficient, and modernized personnel are excellent in providing quality services.

Impact of workforce training on hospital performance-

Hospital performance is a complex phenomenon which includes operational effectiveness, productivity, clinical outcome quality, equipment maintenance, competency of staff, patient safety, patient satisfaction, employee involvement, continuous improvement, etc. The available literature shows that the training programs cater to the needs and requirements of different departments of a hospital have different and measurable effects on the performance of all the employees from top management to the lower level employees and workers of hospital.

1. **Effect of training medical staff:** In hospital, there are different kinds of medical staff who are responsible for diagnosis, treatment of disease to cure patient from illness. In the advanced modern world, there are new medical changes emerging, like advance diagnostic instruments, regulatory changes, telemedicine, etc. This makes it essential for medical staff to undergo continuous training.

Training will provide them update regarding significant changes; this will lead to better diagnosis and efficient treatment which will contribute to hospital's performance.

2. **Effect of training nursing staff:** Nurses provide care to patient, and assist doctors. Nurses are the ones who have to interact with patient, patient's relatives, provide medication, and take care of treatment. Nurses needed to provide training like patient handling, stress management, communication, equipment handling, interpersonal skills, etc. which helps them to deliver quality of nursing care.
3. **Effect of training front office and administrative staff:** Administrative staff includes top management responsible for strategic planning, preparing policies, and arranging budgets. While, front-office staff includes receptionists, patient coordinator who assist in patient admission, maintain record, etc. Training front office and administrative staff helps to minimize errors in operation of hospital.
4. **Effect of providing team-based training:** Hospital conduct department based training programs, like training of nursing department, training of receptionist, etc., but sometimes team based training, like conducting a communication training program which both nursing and pharmacy department will attend collectively this enhance coordination in hospital. Hospitals which regularly conduct team based training generate better clinical outcomes.
5. **Effect on technological training:** As the healthcare industry is witnessing technological advancements in various aspects it is important for every hospital to invest in technical enrichment of its workforce. These training program helps to combine technology in activities like maintain employee record, maintaining patient record, diagnostic instrument handling & maintenance, etc.
6. **Effect on overall organizational performance:** Conducting training programs for all job positions help to increase workforce training, reduce errors, ensures resource optimization in the hospital.

Impact of workforce training on patient satisfaction-

Efficiently implementing the training programs helps a hospital to improve its patient satisfaction level. "Patient satisfaction" indicates the extent of satisfaction with which patients perceive their physical, emotional, and informational needs as being fulfilled and adds to their healthcare experiences.

Impact on Patients: A hospital unit functions to provide healthcare services. Patient is not the only one who develop an experience, but there are- patient's family, friends, relatives- all of them develop certain perspective towards hospital. Every employee based on their duty interacts with the patient. Training

programs give a pathway to employees which help them to give better services. Whether it is informing about treatment and medication; or it is about informing patient about hospital's billing policy. Every aspect is linked to patient. A training program based on increasing employee's ability will reduce errors in service delivery. In every situation, workforce training will give benefit to hospital. If an accident occurs and mass casualty happens then the training based on real situations have been given to employees will help them to cater the situation. The nursing staff will respond properly. The pharmacy staff will ensure proper medication. So, every activity performed in hospital is related to patient satisfaction. Training programs connect employees to the changes in rules and regulations. It also updates employees on training. Patients develop a positive experience towards hospital and create satisfaction.

Challenges

A hospital faces different challenges from multiple dimensions. The training is implemented on employees if they are unwilling to learn then it will create challenge in achieving training objectives. Then, to conduct training it is necessary to have a particular amount of funds if there will be no budget then how a hospital will manage to conduct training. Another challenge is how the hospital provides training, for example, if the hospital is following old training models how it will be able to adapt modern needs of hospital.

1. **Modernization:** In healthcare industry, we can see changes and advancements are taking place. The advancements are so rapid that when employees adapt to one change another change arises. It is difficult for hospital staff to keep up with such rapid changes. They develop resistance.
2. **Budgeting:** In hospital, finance is required to pay employee's salary, purchase medicines, purchase equipment, maintain software, and incur other expenses. Training program also need a certain amount of budget. Mainly, small and govt. hospitals face budget shortage which is why they never really conduct training.
3. **Poor organizational support:** Top management takes all the decisions regarding the hospital. They decide how the hospital's activities will be conducted, how to utilize budget, how to increase hospital values, etc. To conduct a training program, the HR department needs support of top management. Training should be declared as a part of working culture.
4. **Follow-up:** Training follow-up is also challenging for hospital. If there is no follow-up culture then hospital will be unable to find training deficiencies. For example, training is given to nursing staff regarding empathy, follow-up will help the HR department to find whether employees are really

having empathy towards patients or not. Training is a process which doesn't end. After giving training its outcome has to be measured.

Recommendations

1. Set a working culture:

The org. framework of hospital should set training as a part of the working culture. It will help to conduct regular training programs. Training process should keep on going and it should not come to an end with conducting sessions only. An evaluating system should also be there. This system will help to understand the outcome hospital gets after conducting training. A continuous process of personnel development must be adapted as a part of hospital's culture.

2. **Budgeting:** Every activity performed in hospital requires a pre-fixed budget. For the purchase of pharmaceutical products there is a separate budget. A specific amount is kept aside for the payment of employee's salary. Like every department has budget training also needs a separate budget. For example, to conduct a mock drill for fire situation resources, like fake fire scene, dummies, sand, water, fire extinguisher, security alarm all such things will be required. Training is a resource based activity. Even, for conducting classroom based session resources like project screen is needed. Every hospital must set a certain amount for training.

3. Requirement based program:

Requirements keep on evolving. A hospital may need to train its employees regarding communication, or it may need to give training regarding a critical situation which is heavily occurring in the industry. Training is not a "one size fits all" approach. A small hospital has different needs. A big specialty hospital has different requirements. Training should be based on the needs of hospital and the situation of healthcare industry. If the hospital will use same approach of training through the years this might lead to org. failure. To remain competitive in the industry training should keep on evolving. Diverse training programs should be conducted based on employee's job, hospital's objectives, competition, etc.

4. Combining technical resources:

A hospital cannot optimize its operation without the use of technology. In hospital industry, technology is needed in different forms. Every employee must receive training on the utilization of technology in their job. There are computers, diagnostic instruments which are a part of hospital.

Technology helps to make the process fast and smooth. A hospital functions smoothly and improves performance when every staff is aware of the technological use.

5. Identify employee needs:

A hospital has a multi-dimensional workforce which includes different personnel that work together. The training sessions must cater to the development of hospital employees. It is the responsibility of hospital management to identify the needs of its employees. “Every individual have certain expectations from the organization where they are working”. Training binds employees with the hospital and builds cohesiveness and trust amongst employees.

Findings

Training programs conducted in hospital are part of org, policies and gives numerous benefits to a hospital unit by conducting different kind of trainings. There are different ways in which hospital conduct training, like sessions, simulations. But, the purpose of conducting is to achieve hospital excellence by reducing errors and bridging efforts with performance.

Viewing the difficulties in conducting training programs we found how challenging it is for hospital to conduct and implement training. The hospital administration might not support it; they may not allocate funds for conducting training. Another challenge is employees may not even attend training sessions then how it will be possible to implement training when everyone is unsupportive. Even if training is conducted it might use rigid structure or the same approach that has been used since years and still no benefit is earned.

By conducting this study, we have found that training is an essential investment for hospital. Considering the objectives of this research study it is found that workforce training does have a significant impact over patient satisfaction and hospital performance. Every employee in hospital must receive training. Training should not hold rigidity rather it should be designed in such way that leads to hospital growth.

Limitations

The research study depicts certain weaknesses that might be considered for future studies. To conduct the process of training the hospital requires cost as well as time. Training is a lengthy process where different stages are involved. It starts right at the moment when HR department understands the need for conducting training, then a session will be organized which will be followed by a post-training evaluation. As training also involves evaluation so to understand and analysis sometimes the hospital might need experts who will

charge fees. Other limitation is employees may face difficulty in adapting new changes. The hospital may not receive sufficient organizational support to conduct training. Sometimes, the hospital may be unable to receive training result in set time period. Another limitation is that no primary data has been considered to present the information regarding workforce training in hospital. Due to this reason this study cannot be generalized to all hospitals. Another aspect is that the healthcare industry is dynamic so we cannot consider secondary data as relevant to modern trainings.

Conclusion

Training of workforce in a hospital includes various important elements, such as resources, organizational support, cost, time, etc. It is advised to hospital to conduct training at all stages right from top management up to lower level employees. Hospital workforce (doctors, nurses, front office staff, administrative staff, and other medical & non-medical staff) receives necessary training to enhance their performance level. Hospital with strong management and flexible organizational structure receives most benefits of training. Although, there are certain challenges a hospital face while conducting training, like lack of funds, employee resistance to accept changes, rigid organizational policies, etc. still hospital can effectively manage these challenges through strong leadership commitment, proper allocation of resources, resource optimization, flexible training programs, continuous monitoring to identify inefficiencies, and then taking corrective measures. Considering workforce training as continuous and value-driven process hospitals can improve their service quality, patient centered care, and achieve organizational excellence.
